NEW REVENUE GRAB "MUSIC TRUST" AIM

PIN PAN ALLEY BUNCH TO SUE MANY STATIONS

Shall American Society of "Composers" Eke Income from Broadcasters? Case in Court Now

CHICAGO.—Another legal onslaught which observers believed would be the last in the desperate attempt of the American Society of Composers, Authors and Publishers to compel broadcasters in the United States especially to pay license fees for the use of copyright music and the like, was begun here recently when E. S. Hartman, general cently when E. S. Hartman, general counsel for this district, of the organization, filed suit in federal court against the Chicago Board of Trade, owner and operator of Station WDAP, Drake hotel, charging infringement of the copyright

And that which caused the suit was the song, "Last Night on the Back Porch I Loved Her Best of All," published by the Skidmore Music company of New York

Both Sides Determined to Finish Fight So determined apparently were both parties to the suit to fight to a finish that

parties to the suit to fight to a finish that it appeared likely the issue would become national in aspect, involve decisions of the United States supreme court, enter perhaps the halls of Congress.

The planitiff in the suit asked monetary damages of not less than \$250 for each alleged violation of the statute and an injunction against the further broadcasting of copyright music by the station. injunction against the further broadcasting of copyright music by the station. Papers in the suit were served to the assistant secretary of the Board of Trade. Henry S. Robbins, attorney for the Board of Trade, has asked the organized broadcasters that a defense fund of \$10,000 be raised at once to carry the case if need be to the highest court, and to Congress for remedial legislation.

But Two Questions Involved

"Every broadcaster in this country is

"Every broadcaster in this country is affected, theoretically at least, by this suit," said Mr. Robbins, for the defense. "It is a national, a vital issue which must be determined."

"It is a national, a vital issue which must be determined.
"There are only two questions involved —Does the copyright law of 1909 include Radio broadcasting? Does Station WDAP or any other broadcast for profit?" The need for an immediate conference of broadcasters was emphasized by Robbins.

Radio Cuts Sale of Songs?
"The success of any broadcasting station," Hartman said, "is due to its music. The more a song, for instance, is broadcast, the less are its sales. Some of our members who are publishers complain that Radio has cut the sale of certain songs from 3,000,000 to 5,000,000 copies each to 500,000. That condition prevails also in the sale of phonograph records and player-piano rolls.

also in the sale of phonograph records and player-piano rolls.

"Radio broadcasting, we are prepared to prove, is not philanthropic. It is one of the most intensive forms of advertising and as such produces profit. That was and is the aim of the Chicago Board of Trade and of all other broadcasters."

"Most' of Broadcasters Licensed," Hartman

"'Most' of Broadcasters Licensed," Hartman

Hartman said that "'most' of the broadcasters had signed contracts with the American Society of Composers, Authors and Publishers entitling them, for fees ranging upward from \$250, to place copyright music and like productions on the air. Among the broadcasters who had thus become "good," Hartman included stations in St. Louis, Kansas City, Mo., Detroit, Minneapolis and Cleveland. He refused to name the stations specifically.

Minneapolis and Cleveland. He refused to name the stations specifically.

Hartman declared that the American Society of Composers, Authors and Publishers numbered more than 250 members. A printed list showed, after hasty scrutiny, only 18 names widely known as those of composers of music. Further examination failed to reveal the names of noted authors but showed a few notable lyricists.

Would Advertise A. S. C. A. P.

Would Advertise A. S. C. A. P.

A blank contract or license to broadcast, issued by the society, read in part as follows: "This license is not transferable. The licensee agrees to make the following announcement upon the commencement of each program in which special numbers from the repertory of the society are broadcast—by special arrangement with the American Society of Composers, Authors and Publishers.' If required, by the society the licensee agrees to furnish it, upon forms to be supplied, a list of the musical numbers contined in the society's repertory used in each program."

WDT Paid License; Now off Air

the report that Station WDT, Premier
Plano corporation and Shipowners' Radio
Service, New York city, had been compelled to quit broadcasting because of
what were termed excessive license
charges imposed by the society.
The consensus of broadcasters and of
the Radio industry in general in relation
to the contention of the American Society
of Composers, Authors and Publishers

that broadcasting injured the business of that broadcasting injured the business of music publication, phonograph record manufacture and that of player piano rolls, was that the opposite was true. One of the most influential Radio business factors, the most influential Radio business factors, who asked that his name be not made known, declared that the cry of "Radio hurts my business" was inspired by the "music trust." "And of course," he said, "the 'trust' doesn't realize that it was its demands for license fees that hurt the sheet music business. The broadcasters refused to be 'bled' by the 'trust.' They refused to broadcast 'trust' music; the result was that 'trust' music lost the advertising or 'sales plugging' given by

result was that 'trust' music lost the advertising or 'sales plugging' given by Radio and the volume of sales dropped.'

Record Makers Now Go On Air for Ad Similar conditions obtained in the phonograph industry, he maintained. "Makers of phonographs are linked in a sense with the 'music trust'," he asserted, "in that they make records of 'trust' music. Radiophans, unacquainted with the phonograph records of 'trust' music, called for records they had heard by Radio. Of course that they had heard by Radio. Of course that hurt the sale of the other kind of record. hurt the sale of the other kind of record. And that's why two of the largest phonograph companies, the Victor and the Columbia, have become allied with Radio broadcasting. The latter concern now rents Station WEAF, New York, at regular intervals to broadcast its latest records. Why? Good advertising, of course. The Victor is installing a station at its Camden, N. I. plant" N. J., plant.

"Music Trust" Chain of Coins

The latest suit of the American Society of Composers, Authors and Publishers is a or Composers, Authors and Publishers is a link in the chain it has forged to bind the broadcasters of the United States, it is said, to place on the air only that music or like creation which it controls. The chain

SANDWICHES GIVEN COLUMBUS STATION

Basketful Is Answer When Announcer Asks for Word from Fans

LONDON, O.—An announcer from a Columbus station recently told his listeners that the station once in a while wished to hear from all sections reached and mentioned that they had not heard from London for some time, and at the same time stated that several other places had been missed. had been missed.

The next night, the announcer stated that the station still had received no word from London or vicinity and asked that someone send in word if the programs were being heard there.

The local Radiophans heard this. Thirty minutes later they were surprised to hear

The local Radiophans heard this. Thirty minutes later they were surprised to hear the announcer state that he had heard from London with a vengeance; that one London enthusiast had called the Deshler hotel, Columbus, by long distance telephone and ordered a basket of sandwiches sent to the broadcasting station. The announcer stated that the response was most gratifying and pleasing to the station.

MINNEAPOLIS.—Records now being compiled by the Twin City Radio central, WLAG, are believed to indicate that the practicability of daylight broadcasting is to be demonstrated shortly and that one of the big developments in the near future will be the increase of daytime programs.

Boom Daylight Broadcasts

will be the increase of daytime programs.

CALL R.C.A. MONOPOLY

(Continued from page 1)

organic act prohibiting unfair competition in trade.

in trade.

In the language of the complaint, which is called a sweet morsel to every Radiophan and independent Radio manufacturer, "The respondents (firms named) have combined and conspired for the purpose and with the effect of restraining competition and creating a monopoly in the manufacture, purchase and sale in interstate commerce, of Radio devices and apparatus and other electrical devices and apparatus, and in domestic and transoceanic Radio communication and broadcasting."

casting."

How Radio Monopoly Grew

How Radio Monopoly Grew

In explaining how the present alleged control of Radio had reached its powerful and what is called dangerous magnitude of today, the Federal Trade Commission recites that the firms named:

(1) Acquired collectively patents covering all devices used in all branches of Radio, pooled the rights to manufacture, use and sell Radio devices covered by these patents, and then allotted certain of the rights exclusively to certain of their firms.

(2) Granted to the Radio Corporation

their firms.

(2) Granted to the Radio Corporation of America the exclusive rights to sell the devices controlled, and required the Radio Corporation to restrict its purchases to certain of the firms named.

(3) Restricted the competition of certain of the companies in the fields occurred the companies in the selection of the companies in the server.

cupied by other companies in the agreement.

ment.

(4) Attempted to restrict the use of Radio apparatus manufactured and sold by themselves (the respondents).

(5) Acquired existing essential equipment for transoceanic communication and flatly refused to supply to others necessary equipment for such communication; also excluding others from the transoceanic field by preferential contracts.

Combine Sews Up Vacuum Tubes

From the series of contracts referred to in the trade commission's complaint, it appears that the Radio Corporation of America, long criticized by Radio Digest for its policies, has the right to use and sell under patents of the various firms in the combine which relate to the Radio art. It has also given the various respondents the right to manufacture under these patents.

spondents the right to maintacture these patents.

Thus, by a series of manipulations which would reflect great credit on the brains of their makers were it not for the public menace they are believed to have become, there has been combined in the hands of the chosen few corporations to patents covering vital imnot only the patents covering vital improvements in the vacuum tube, but also many other important Radio patents or inventions supplementary to this keystone device, the three element tube.

Guess Who Controls Radio Corporation?

The report of the Federal Trade Commission shows that the gross income of the Radio Corporation of America in 1922 was \$14,830,856.76 and that its total capital stock on December 31, 1922, was \$33,440,033.56. The total capital stock is made up of 3,955,974 shares of preferred and 5,734,000 shares of common, or a total of 9,689,974 shares of stock. Who owns this stock?

The table below showing the holdings in the R. C. A. of but several of the respondents named in the federal complaint should answer the question. The holdings reported are: No. of No. of

Shares Shares Preferred Common Respondent's Name General Electric Com-Co.....1,000,000 1,000,000 Mfg. Amer. Telep. & Teleg. 400,000 None United Fruit Company 200,000 160,000 3,036,000

Grand total shares controlled by respondents5,256,800

How R. C. A. Sold 5,509,487 Tubes

How R. C. A. Sold 5,509,487 Tubes
The report of the commission also finds that up until 1922 (when the Fleming Valve patent expired and allowed De-Forest to make and sell his own invention, the three element tube), the Radio Corporation had an absolute monopoly in the manufacture of vacuum tubes.

It was therefore able to sell 5,509,487 such tubes during the first nine months of 1923. The DeForest company sold but 94.100 tubes during that period.

94,100 tubes during that period.

R. C. A. Has World in Hand

In the commercial Radio communication field, while the R. C. A. still has a little competition in ship-to-shore communication, it has a virtual monopoly in transoceanic service. The R. C. A. controls all the high power stations in this country except those owned by the United country except those owned by the United States government.

In addition agreements of an exclusive character have been entered into with the

"HELP!" CRIES FAN TO "PAPA" HOOVER

TEMPER SHATTERED DAMPHOOL SPARKS

"I've Helped Russia," He Writes, "And Now I want Relief Myself"

WASHINGTON.—Complaints relating to Radio interference are received daily by Secretary of Commerce Hoover, who has become a sort of "fosterfather" of the Art, now regulated under the 1912 law by his bureau of navigation. A recent and unique communication from a fan located on the Florida peninsula, where ship traffic is heard almost constantly ship traffic is heard almost constantly, has caused amusement in high official

The letter, which follows, voices a pathetic appeal from an apostle of Hooverism and demonstrates the need for definite regulatory laws:

"My dear Sir:
"Help!!!!
"When you called upon me to conserve, "When you called upon me to conserve, I conserved. When you asked me to sweeten my food with the milk of human kindness, I got indigestion using Florida cane syrup in my coffee. When you asked me to come across, I stepped on the gas. When you asked for help for the Near East, I went the limit. When you asked for help for Russia, I sent over a few safety razors and barber shears.

Now He Wants Relief

"I have been for you in your every endeavor. I have Hooverized until I didn't know 'hooves-who.'

know hooves who.'
"Now I want RELIEF.
"I have \$700 invested in a Radio set.
It functions perfectly but every program
is deadened or the fine passages lost by

is deadened or the fine passages lost by the damnable interference.

"And this not for one night but every night for a year back, and from any time in the day until I quit in disgust.

"Night after night I try until my patience is exhausted to get decent reception and, may be for a minute, sometimes two minutes, a song or music comes in as clear as a bell, and then some deep throated spark begins to shatter the atmosphere. Then the amplifier takes it up and another station is lost. Some damphool is playing with the keys of his transmitter—or telling some buddy or some other rumrunner that he has a date when on shore with some calico.

when on shore with some calico.

Florida Worse Than Dante's Inferno

There must be some relief. Were there
periods of ten minutes even when one
could listen in to lectures, songs or music

could listen in to lectures, songs or music without interference I would have no complaint. But it is incessant.

"Dante's Inferno can be no worse than the noises that come to us here in the peninsula of Florida. In relief work, in drives, in everything, you have accomplished the seemingly impossible—let us have relief."

Mr. Hoover's answer to the Florida fan

Mr. Hoover's answer to the Florida fan Mr. Hoover's answer to the Florida fan has not been made known, but it is understood that he realizes keenly the need for more authority to regulate Radio, both ashore and afloat, even though the voluntary agreement laid down by past Radio conferences has greatly modified the interference.

ference.

Legislation defining his duties and setting forth rules and regulations as to amateur, commercial, private and other forms of Radio communication is urgently desired by the secretary, as well as additional appropriations and personnel for better and more frequent inspection of stations causing interference.

Wendell Hall Sings His

"Blue" Songs for WEAF

NEW YORK.—"Blues," not of the sulphurous nor of the lugubrious kind, feaphurous nor of the lugubrious kind, featured the recent programs of Station WEAF, American Telephone and Telegraph, this city. They were the sapphire songs of Wendell Hall who, through Station KYW, Westinghouse, Chicago, has won fame. While in this city Hall arranged with a leading phonograph company to make four "blue" records.

SHOWS RADIO VALUE IN RESCUING MINERS

AZELTON, PA.—Opposition to the theory that Radio could be utilized in mine-rescue work was upset in a sense near here re-cently when John Fritz of Audenried, who had installed a set in an anthracite mine 200 feet from the surface, afterward reported that he had heard aimost every broadcasting station ordinarily heard above ground.

BLIND YOUTH LEARNS MUSIC BY AIRWAVE

LK CITY, KAS.—A blind boy musician of this town recently wrote to Station WEAF, New York City: "Radio helps me learn new pieces and keep pace with popular songs." The lad asked WEAF to help him find a job at the piano or drum in theater, cafe or dance hall. The station said it would forward such information to the lad.

FOLLIES QUEEN LOVES HER RADIO

Merry Ann Pennington, of Ziegfeld Follies fame, is ever happy with her Radio set, but here the camera man has caught her with a particularly pleased expression, and even if she has been "left out in the cold," as the furs seem to indicate, she evidently harbors no grudge against this old world of ours.

BAND REHEARSES AT KHJ TO HONOR SOUSA

Famed Musician and His Men Also in Concert

LOS ANGELES .- That there is something new under the sun was revealed throughout a great part of Radioland recently, when Hiner's Los Angeles Band was presented in a Radio rehearsal over Station KHJ, the Los Angeles Times, as a tribute to Lieut. Com. John P. Sousa, and his band of 100 musicians, who were the guests of Los Angeles.

It was the desire of Dr. E. M. Hiner in presenting his concert four days earlier to inspire the listeners in of Radioland to a desire for "better" music.

to a desire for "better" music.

Fifty musicians of the band produced beautiful music which, with the aid of the transmitter of KHJ, was able to fill the great auditorium of ether. Under the guidance of Dr. Hiner, the band was directed through two hours of difficult compositions, each of which was interspersed with one of Sousa's stirring marches.

Always keep the plate and grid leads far apart. If they must be run close, have them run at right angles to each other. This will reduce howling.

KANSAS CITY OPENS ITS PURSE STRINGS

CONTRIBUTE TO BUY SETS FOR CITY'S INVALIDS

Gives His Sanction and a Check—Merchants Join

KANSAS CITY, MO.—Had Jean Wurmser, 16 years old, been able to get out and play like normal boys, Kansas City might never have opened its pocketbook to pro-vide Radio sets for the several such invalid children here.

vide Radio sets for the several such invalid children here.

Jean has been an invalid since birth, paralyzed in both legs. He never told anyone except his mother about his desire for a set to lift the gloom that is necessarily the lot of one who must always remain within the confines of his home. Mrs. Wurmser had found such difficulty in keeping up the home and in supporting herself and two children that she could never quite set aside enough from her \$12 a week to purchase even the simplest receiving set for Jean.

Money Saved for Set Needed for Coal
At one time this winter she did have four dollars put away toward the set, saving a nickel or dime at a time, but then it turned unusually cold and stayed cold so long she was forced to use the reserve to purchase coal.

The little mother was faithful—she didn't complain. It was just a chance bit of conversation that caused her to reveal to a friend that the severe weather had beat Jean out of the Radio set he had been looking forward to for so long. But that was sufficient. The friend

had been looking forward to for so long. But that was sufficient. The friend passed the word along and that same day passed the word along and that same day a movement was organized to provide sets not only for the Wurmser boy, but for every other invalid in the city. Many merchants, catching the spirit of the movement, offered to accept contributions from the public which each day would be turned in to the fund headquarters.

Movement Takes City by Storm

Two days after the birth of the movement four crystal sets and an extra pair of phones had been contributed in addition to the pecuniary gifts.

tion to the pecuniary gifts.

Magnetically the spirit spread. Everyone seemed to be eager to assist in proone seemed to be eager to assist in providing pleasure for the city's unfortunates. Certain Radio dealers agreed to furnish sets at cost, volunteers offered to install aerials and other outside wiring without remuneration and the contributions have shown no indication of ceasing

tions have shown no indication of ceasing to pour in.

Mayor W. W. Gordon has given the movement his indorsement and a check. Other city officials were among the first to contribute, children brought their pennies, business men usually made the offering one dollar. Kansas City, long noted for its generosity to the needy, again had responded to call.

SWEETER VOICES ARE **BROADCAST RESULT**

New Vocal Technique Developed Says Music Leader

MINNEAPOLIS .- Radio is developing an entirely new type of vocal artists with voices surpassing in sweetness and tech-nique those of concert and theatrical stage stars, it is declared by Miss Eleanor Poeh-ler, music educational leader of the Northwest, one of the few women execu-tive directors in complete charge of a large Radio broadcasting station.

Miss Poehler, as director of the Cutting Miss Poehler, as director of the Cutting and Washington Radio corporation's station, WLAG, popularly known as the Twin City (Minneapolis and St. Paul, Minn.) Radio central, has for some time been experimenting with these "Radio voices" and developing them.

"This extraordinary invention—Radio—is opening a field that is epochal for new artists and giving the public the benefit," said Miss Poehler.

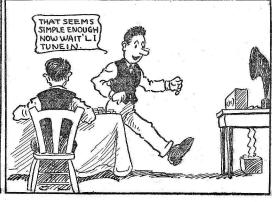

Before taking charge of Station WLAG, Miss Poehler was prominent in western musical circles as a soprano soloist.

THE ANTENNA BROTHERS

Spir L. and Lew P.

A Broadcast from China

SUGGEST SPECIAL

HOURS IS PLAN

Difference in Time Moves Station Offi-cials to Consider Early Morn-ing Programs

NEW YORK.—A suggestion that the National Association of Broadcasters arrange a schedule of its members for broadcasting late programs for the benefit of Pacific coast listeners, is being seriously considered and may be put in effect.

Inasmuch as there is a difference of three hours between Eastern standard and Pacific coast time, and two hours between Central standard and Pacific coast time, an eastern station signing off at 10:30 eastern time would be stopping its program at 7:30 on the Pacific coast, and a midwest station signing off at 10:30 central time would be stopping its program at 8:30 on the Pacific coast.

The N. A. B. stations are being asked if they believe that special early morning broadcasts for Pacific coast listeners would be a desirable project. If the suggestion is acted on it will mean putting on programs approximately between the hours of 1 and 3 o'clock in the morning.

N. A. B. Would Arrange Schedule

N. A. B. Would Arrange Schedule

N. A. B. Would Arrange Schedule

If such a plan is found desirable, the
Association will arrange a schedule, so
that each station which considers this
service advisable, can go on the air one
night a week, or if a sufficient number
are favorable, perhaps once in two weeks.

An argument given in favor of the proposed plan is that Pacific coast listeners
now have little reason to buy long distance sets, because all eastern stations
have signed off before interference from
their local stations has ceased. Another

have signed off before interference from their local stations has ceased. Another argument is that performers could extend their publicity to the Pacific.

Stations wishing to express themselves on the plan are requested to communicate with Paul B. Klugh, secretary of the National Association of Broadcasters, 1265 Broadway, New York.

BROADCAST UPKEEP CONFRONTS CANADA

CONSIDER SUBSIDIZATION AS ONE ANSWER

Dominion Sees Need of Supplying Her Own Service for Listeners

OTTAWA.—To be or not to be subsidized is a question which is engaging the attention of broadcasters throughout Canada, and which may soon require from the Dominion Government a definite "Yes" or "No." There are over 100,000 listeners in Carada and broadcasting is the life of or "No." There are over 100,000 listeners in Canada and broadcasting is the life of the Radio world. Again, it is of importance to Canadians that as much as possible of this should be of home origin.

Encouragement of some form to the broadcasters would be one means, but if this were carried out the Dominion Government might be open to the accusation of subsidizing instruments of propaga-tion in its favor, such as newspapers which have installed broadcasters. It is now being done in Manitoba, where the Provincial Government is operating the Provincial Government is operating a broadcaster through the Telephone Commission's facilities. That installation is subsidized by the Dominion Government in this way: Half of every Radio license fee of \$1 paid by citizens of that Province to the Dominion is turned over to the provincial government to aid in maintaining the broadcasting system.

Caribbean Cruisers to Ride Waves with Phones

Will Listen In to Home Station at Fort Worth

FORT WORTH, TEX .-- One of the special amusement features of the Caribbean Cruise to be conducted by the Star-Telegram, March 20 to April 9, will be Radio programs on board the S. S. Cartago, of the United Fruit Company line, the ship on which the cruise will be made.

A special receiving set will be installed

and passengers will listen in to programs from WBAP, the Star-Telegram here, and other stations in the United States. Special efforts will be made to insure clear reception of programs.

RADIO NAMES SONG; OTHER MEANS FAIL

PUBLISHERS IN NEW YORK RECEIVE 5,000 TITLES

Owners of Hit Offer Royalty to Winner After Tin Pan Alley Admits Defeat

NEW YORK .-- For many months Charles Tobias and Louis Breau, publishers of songs, widely known as pioneers in broad-casting "hits," tried to find an appropriate casting "nits," tried to find an appropriate title for a fox trot whose rhythm, they said, was novel. Finally, after every other means had failed, they appealed to the Radio audience of Station WHN, Loew's State theater, 45th and Broadway, and found not one but many suitable names.

found not one but many suitable names. The publishers who, during the last two and one-half years, have broadcast songs from Stations WJY, WJZ, WEAF, KYW, WOR, WHN, WDAP, WMAQ, WAAM and others, appealed at first to the professional lyricists of "Tin Pan Alley" where most of the popular ditties of the nation are conceived. But nothing suitable was found.

Radio Brings 5,000 Names Radio Brings 5,000 Names

For two weeks or more the song lay in the publishers' office, a thing of regret and irritation. A few nights ago, the publishers fell upon what they at first thought was a "wild" idea—they determined to let the Radiophans, the listeners in, try to name the new melody.

The announcer for WHN, Nils T. Granlund, put the publishers' plight on the air. Shortly afterward more than 5,000 suggestions for names were received by mail, telegraph and telephone. Many fitting

gestions for names were received by mail, telegraph and telephone. Many fitting titles were among these, according to the publishers, but to give thousands of other listeners in opportunity to compete, the contest was continued three weeks. The name of the winner will appear on the title page of the song and he or she will be given opportunity to write the lyric under a royalty contract.

Away Up in Canada WTAS Wins Aid for Griffis Fund

CHICAGO.—Although Mr. M. Ercury wings his feet so fast 'way up North that wings his feet so tast way up North that during the winter he usually arrives near the bulb of the little glass tube which makes weather seem real, he didn't, a few days ago, drop so low as to prevent the warmth of the appeal for funds to release Griffis from a German prison to reach at

Griffis from a German prison to reach at least one Canadian.

It was Radio which defeated M. Ercury; Radio as broadcast from Station WTAS, Elgin, Ill. In a letter to those in charge of the fund in this city, C. L. Pickering of Cochrane, Ontario, said that WTAS's plea had induced him to send money to effect the freedom of Griffis, who had tried to kidnen Regradul fugitive slecker. Station kidnap Bergdoll, fugitive slacker. Station WJAZ, Edgewater Beach hotel, and several theaters here also broadcast appeals

The French deny that the pilotless airplane is an American invention, and furnish conclusive proof that in September of 1918 a pilotless plane was successfully controlled from the Eiffel Tower.

Yukon Miners Dance to Music from Portland

Best Orchestras of Continent Heard in North

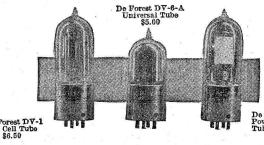

DAWSON, YUKON.—Denizens of the Yukon are dancing this winter to music played by the best orchestras of the continent through the medium of the Radio-phone. Now that the period of the shortest daylight is reached, Radiophans re-ceive good results from their instruments. Miners at Miller Creek and Keno Hill

have experimented, and found they can

tune in on Radio concerts for their dance music. Concerts broadcast from Calgary, Alberta, Portland, Ore., Los Angeles and San Francisco compete with music from distant Eastern cities these nights to beguile the unbroken twilight of the sub-arctic winter. arctic winter.

Greece to Have Radio

WASHINGTON.—Radio communication will be established throughout Greece by the British Marconi company under an agreement which has just been signed with the Greek department of communications, according to a report received by tions, according to a report received by the United States department of com-merce. Stations will be erected in the principal cities.

The More You Know About Radio The More You Rely on De Forest

Without Lee De Forest's discovery of the vacuum tube there would be no radio today. All radio broadcasting, all radio receiving by means of tube sets, rests on De Forest patents.

De Forest has been a pioneer in radio since 1900 and De Forest is a pioneer today. That is the reason for the great success of the De Forest Reflex Radiophone. That is the reason for the success of the new De Forest tubes-DV-1 Dry Cell Tube, DV-6-A Universal Tube, DV-2 Wet Cell Power Amplifier Tube.

If you want a radio receiving set with a range on indoor loop of from 1,500 to 3,000 miles, depending on atmospheric conditions; if you want simplicity of control, clear reception without distortion and without extraon either wet or dry cells-see the De Forest Reflex Radiophones at the De Forest agents today.

The D-7 A Reflex Radiophone is a three-tube set at \$125.00; the D-10 Reflex Radiophone has a drawer in its cabinet for dry batteries and is a four-tube set at \$150.00. No matter what you pay, you can't get greater radio satisfaction.

Whether you buy your set complete, or build your own from the laboratorytested De Forest parts, you can rely on De Forest, the greatest name in Radio.

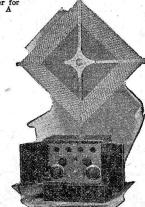

De Forest Radio Tel. & Tel. Co. Jersey City, N. J. Dept. R. D. 6

De Forest Portable Reflex Radiophone type D-10, which operates on wet or dry cells, has a reception range of from 1,500 to 3,000 miles on indoor loop; has drawer for all necessary and B dry cells, Price \$150.00, blus approxi-

KANSAS OPENS FARM STUDY TO ALL FANS

STATE U COURSE BEGINS ON FEBRUARY 11

First School of Kind Offers Written Quiz-President Sees Radio as Necessity

MANHATTAN, KAS.—Kansas State Agricultural college of this city will join the ranks of the universities communicating college courses to a widely separated student body by Radio, when on February 11, a complete course in agriculture will be opened to everyone in the United States, it has been announced by President J. M. Jar-

In order that the farm course may bring material results, President Jardine has asked Radiophans throughout the country to apply for enrollment in any or all of the courses on the extension Radio schedule. The most important agricultural sub-

jects will be included, it was said.

At the completion of the course a written examination will be given all students.

A passing grade will entitle the Radio student to a certificate of graduation from the first school of its kind.

School Will Influence Farm Life
The entire course will be broadcast on 286 meters from the university station,

WTG.
"Radio's greatest contribution to the advancement of civilization may lie in the influence it will have upon the life and action of the farm population," President Jardine said in announcing his school's

unique plan. "The great new science is to become an imperative necessity of the economic, spiritual and intellectual life of the farm. It will mean the delivery of the farmer from the sense of isolation by keeping boys and girls on the farm and by making possible

a system of agricultural education."

President Jardine has asked all Radiophans interested in the course to communicate with him before the "school of the air" is opened.

RADIO TELLS HER OF PERIL TO SON

Mother of Sailor on Ill-fated Tacoma Learns of Danger by Airwave

CEDAR RAPIDS, IOWA .- To be "listening in" on a set and suddenly hear that the ship on which your son was a sailor had been wrecked, was the experience of Mrs. John Patterson, 313 Twelfth avenue west, on a recent evening about 10:30 o'clock.

Mrs. Patterson had tuned in on Station WFFA, Dallas, Texas, when she heard the announcer tell that the old cruiser Tacoma, which had gone aground near Vera Cruz, Mexico, was battered to pieces and would soon go down.

Mrs. Patterson screamed when she heard the news, attracting the attention of her husband. She told him of the announcement when he rushed into the room and they worried and wondered what had been the fate of their son, Robert, 24 years old, who had been a water tender on the vessel. Neither had read of the mishap to the ship as announced in the newspapers until they heard of it through the Radio receiving set in their

home.
Mr. Patterson was relieved next morning when at the office of a local newspaper, he learned that there were only four of the crew dead and his son was not among these. The rest of the crew had been saved in the face of a heavy storm by Mexican rebel boats.

WLAG Reception Good, Is MacMillan Message

Twin City Radio Central Wins Explorer's Praise

MINNEAPOLIS MINN -WLAG Twin City Radio Central, Minneapolis and St. Paul, announces that it has recently joined the list of stations to receive the applause of Capt. Donald MacMillan's North Pole expedition.

Through Jack Barnsley, Prince Rupert B. C., the station has received the follow-

ing message from Capt. MacMillan:
"WLAG very good here occasionally.
Please extend New Year's greetings to D. D. Davis of Washburn Crosby Flour Co."

The message was communicated to Mr. Barnsley by the Schooner Bowdoin at Refuge Harbor, Greenland, at 2:28 a. m. WLAG is about 2,800 miles from the position of the Bowdoin at latitude 78.30 N., long. 72.30.

A high power wireless station is about Allight power with the state of be in operation within two years.

LISTENING IN FROM WAY UP NORTH

By Vera Brady Shipman

TEIGHBELLS coming over the hills; prancing horses frisking with the cold; a long drive from town; the lookout light shows afar; it gets dark early in winter. Wonder how it would early in winter. Wonder how it would feel to get lost? Come inside while they put up the team.

Come inside while they put up the team. The log fire welcomes. It's far below zero tonight. Wish KYW would put on the setting up exercises now instead of 7 in the morning. It's too cold then to enjoy it. Wish we could telegraph some of those Radio stations we hear so well, but central in our little town closes at 9 o'clock. tral in our little town closes at 9 o'clock. THE MARKET WAVE TRAPS NOW

Manufacturers Meet Demand for Interference Eliminators with Two New Models

Tests Made on Two Types

Malone-Lemmon Control-O-Meter and Metro Wave Selector Explained for Benefit of Fans

N AN effort to locate and test various standard wave traps, selectors or whatever name they might be known by, it was found that there were not as many on the market as might be anticipated. Undoubtedly in various cities there are numerous traps available at dealers which are only produced for local dealers which are only produced for local trade. The idea, however, was to describe a few that have a more national distribution. Evidently the demand has been great because manufacturers were not in a position to deliver instruments for testing purposes for testing purposes.

Two were available, but details of other instruments will follow later. The first one shown in the illustration is the "Control-O-Meter," a Malone-Lemmon product. The instrument is well made, having a sloping panel with two binding posts and one control dial.

A card accompanies each instrument on which is given the calibration for eliminating specific wave lengths. On the one tested this is given as follows:
Undesired Wave Length Dial Setting

Dial Setting Undesired Wave Length

300	meters.	٠							·	٠	٠			•	22	
350	meters.		٠			ě			×				ě	×	29	
400	meters.						·								38	
450	meters.							ě	÷					ě	49	
	meters.															
														Æ.	111 (3 444-1711	

The instructions on this card should be

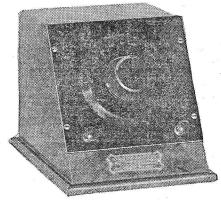

of interest.

1. Set the instrument in a convenient location alongside the receiving set. Avoid having the connecting wires too long.

2. Disconnect the antenna lead wire from the set and attach it to one binding

post of the meter. Now connect the other post on the meter to the antenna binding post on the receiving set. 3. Each instrument is tested and cali-

brated before shipment, results being noted on the "Factory Record."

Malone-Lemmon "Control-O-Meter."

Setting of Instrument

The method of setting the instrument is as follows: Assume that WJZ (455 meters) is interfering with a concert from WEAF (492 meters). To eliminate WJZ, refer to calibration table on back of the instruction card and note that the wave length of 455 meters lies between 450 and 500. In column "Dial Setting" under "Factory Record" are the figures corresponding to 450. Slowly rotate dial between the figures corresponding to 450 and 500 until the point is noted at which interference diminishes. By advancing or terference diminishes. By advancing or retarding the dial a few degrees from this position a point will be found at which WJZ is completely eliminated.

4. It will be found that when the interfering station is once eliminated by a careful setting of the instruments, a further readjustment of the main receiver will not again bring back the interfer-

5. The adjustment of the Control-O-Meter to completely eliminate interference is quite sharp, loud signals disappearing within a few degrees on the dial. In exceptional cases, supersensitive In exceptional cases, supersensitive receiving sets located alongside of a powerful broadcasting station may require an additional instrument inserted in the ground lead.

The Wave Selector

Another instrument, shown in the second illustration, is the "Wave Selector" manufactured by the Metro Electrical

Metro "Wave-Selector."

Company. This instrument is enclosed in a very neat compact case with a hinged cover. Instructions are pasted in this cover and are as follows:

1. Binding post marked "Aerial" should be connected directly to the aerial.

2. Binding post marked "Set" should be connected to receiving set where the aerial usually connects.

3. Before adjusting main receiving set, the dial on the selector should be set approximately at 90.

4. The main receiving set is now adjusted in the usual manner in order to bring in the desired station to the greatest signal strength, regardless of interference.

5. To eliminate the interfering station, the dial on the instrument should now be slowly turned either to the right or left until the undesired station is at its minimum strength.

6. If the undesired station is still present, it wil be necessary to again adjust the main receiving set, with a final very slight adjustment of the selector.

latter affects the tuning of the selector. It is only by the careful adjustments and re-adjustments of both in combination that the two circuits can be absolutely balanced and the undesired station en-

AH, WOE! ANOTHER ONE'S WED, GIRLS

Pheminine Phans Lose Second Idol at WGR, Buffalo

BUFFALO, N. Y.—Alas and alack! Here is more bad news for pheminine phans. After L. B. Weller got married and ceased forthwith to be chief announcer for WGR, the no less dulcet accents of Edward Stanko began to be heard from Maine to California as chief spokesmen at the Buffalo station.

man at the Buffalo station.

Some of those same pheminine phans who used to send Mr. Weller mash notes are beginning to get keyed up over Mr. Stanko's voice and now along comes the

news that he too is married.

The ceremony took place in Buffalo recently before City Judge Harry B. Lamson. Miss Fay Pepley of Hooversville, Pa., was the bride.

Bryan's Talk-"Is Bible True?"—Is Sent by WMC

MEMPHIS, TENN .- What were deemed MEMPHIS, TENN.—What were deemed forceful arguments against modernism in the church were presented here recently by William Jennings Bryan by means of Station WMC, Memphis Commercial Ap-

The "Commoner's" address, delivered to a large audience in a church, was relayed to the newspaper's Radio plant, whence it was put on the air. The title of Bryan's lecture was "Is the Bible True?" The applause which his points evoked indicated that most of those who heard him still believed in the spiritual verities.

7. Remember that every adjustment of the selector affects the tuning of the main receiving set and every adjustment of the without mouth and hear without ears. Radio is described by a native of Africa as a powerful machine that can speak

NEW REVENUE GRAB "MUSIC TRUST" AIM

TIN PAN ALLEY BUNCH TO SUE MANY STATIONS

Shall American Society of "Composers" Eke Income from Broadcasters? Case in Court Now

(Continued from page 2)

is made of coins, according to recent data, which, in considerably less than a year, total more than \$500,000.

Research conducted during the last few months by broadcasters individually and months by broadcasters individually and as a national organization shows that, in the instance of a popular Radiophan contest under the auspices of Stations KYW, WJAZ and WDAP, Chicago, during a period of less than 12 days, more than 13,170,500 men, women and children heard the terms of the competition, that more than 240,000 answers were received and than 240,000 answers were received and that the greatest number of these pre-ferred "jazz" or "popular" music, showing how large was the audience which the organized publishers might have reached.

Tests Show Radio Aids Music Sales

Further investigation revealed that the local and mail order sheet music sales of the Knight, Campbell company, Denver, Colo., were greatly increased by being broadcast by Station KFDL of that city. An "independent" sheet music publisher in New York City reported that Radio had New York City reported that Radio had raised the volume of his sales of one song to 25,000 in a short time. Another publisher in the same city, rather a partnership of publishers, told how, by means of Radio, Station WHN, they had received 5,000 suggestions as to a title for a song which "Tin Pan Alley," habitat of composers and authors, had failed to name appropriately. It became known that some of the music publishers paid as much as \$10,000 a year for "plugging" the sales of one of their songs.

Hartman and Rosenthal Lie?

Martman and Rosenthal Lie?

The question re-opened by the suit against the Board of Trade brought into conferences during 1922 and 1923, in Chi-cago and New York, representatives of the American Society of Composers, Authors and Publishers, and the broadcasters.

Delegates from the American Telephone and Telegraph company, Radio Corporation of America, General Electric, Westinghouse, and the United States departicularly.

ment of commerce attended the meeting in New York City. The assembly in that city ended in a deadlock. One of the meet-ings ended in an agreement to file a test suit in the federal courts.

During one of the later conferences in Chicago Hartman, attorney for the organized publishers (and composers and authors), and J. C. M. Rosenthal, their general manager, were asked to withdraw because, it is alleged, of a deliberate misstatement.

Broadcasters Oppose Tactics of Society

A questionnaire under the auspices of the Drake hotel, Chicago, and Radio Digest showed that most if not all the broad-casters of the United States opposed the tactics of the society and favored the use of "independent" music. The National Association of Broadcasters, of which Paul Association of Broadcasters, of white Faut Klugh was and is executive chairman, headquarters New York City, established a bureau for the cultivation of "indepen-dent" music. The Chicago Daily News, Station WMAQ, aided the association considerably in that respect.

Methods of the American Society of Composers, Authors and Publishers, as applied by some of its representatives. were condemned by broadcasters and thousands of listeners in.

Is Fight of Millions of Listeners In

The repeated declaration by members of the society's legal staff that Station WEAF, American Telephone and Telegraph com-pany, New York City, had become a li-censee was afterward proved a misstatement as was a similar assertion during the trial of the suit against Station WOR in Newark.

It is reported that some of the members of the American Society of Composers Authors and Publishers on several occastons came over to the Drake station and attempted to get WDAP to broadcast their numbers by issuing a written "release." These members had no right to do this, it is obvious, considering the stand of the Society, and their attempts can only be credited, it is believed, to internal dissension or an organized effort to "frame" WDAP.

The fight of the National Association of Broadcasters, of its individual members, to retain the right to the freedom of the air, the right to place on it what they wish excepting that which conflicts with present Radio regulations, has become, it is said, the fight of millions of listeners in throughout the United States. On the outcome of the suit filed against the Chicago Board of Trade depends in a sense, it is predicted, the life of broadcasting in this

The names Dresden, Rembrandt and Sterling mean a lot when you are buying china, art and silver. But when Radio is considered, the name Flewelling is paramount. The careful buyer has learned that if it is a "genuine" Flewelling part it is right! E. T. Flewelling will not allow his name to be placed on a part that has not passed both laboratory and practical use tests. Genuine Flewelling parts are manufactured exclusively by

How to Makea Lighthouse Keeper's Receiving Set

Part I—Portable Set Suitable for Everyday Use

By S. R. Winters

PORTABLE Radio receiver, representing a cash investment of only \$20, and so simple in structural details that a person with the slightest elemental knowledge of electricity can assemble the parts, has been designed by A. W. Tupper, assistant engineer of the Lighthouse Service, United States Department of Commerce. Furthermore, the set is compact, the cabinet, instruments, and dry-cell batteries weighing barely 15 pounds. A single vacuum tube is used, which, besides the headphones, is the only expensive unit used.

This receiving equipment was designed especially for keepers of lighthouses—those lonely guardians of property along our 44,000 miles of coast line. One of these lighthouses, for instance, is perched on a rock in the Pacific Ocean, miles from

on a rock in the Pacific Ocean, miles from land. The installation of the receiving set about to be described on this rock, will dispel the isolation by bringing civilization—music, church services, financial reports, lectures, etc.,—into mid-ocean by the magic of the invisible electromagnetic

waves.

Adapted for Universal Use

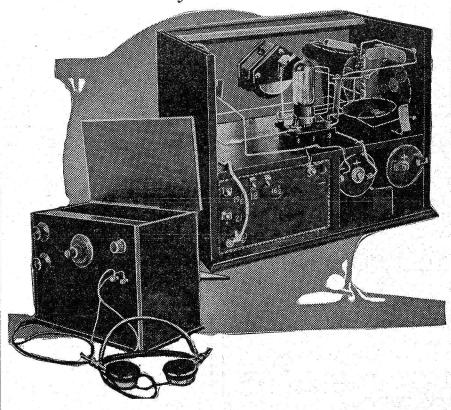

This compact Radio receiving set, perfected fortunately, is not limited in usefulness to the lighthouse. It is equally adapted to home, office or field, where inexpensiveness, simplicity, compactness, and long-distance reception are sought.

The opportunity for the farmer to display his mechanical skill in making and assembling the parts entering into the

assembling the parts entering into the construction of the Radio telephone equipconstruction of the Radio telephone equipment is not to be discounted. The city dweller, too, who is swinging away from electric circuits involving cumbersome units and bulky storage batteries, will appreciate the possibility of building and assembling a set of such light weight that one person could easily carry cabinet, instruments, and batteries anywhere he might go.

might go.

The materials necessary for building this simple form of regenerative circuit have been so explicitly outlined by the Lighthouse Service that even the size and number of screws are specified. For two the state of the materials are like. tunately, some of the materials are likely to be found around any home which houses a person with a mechanical turn. Moreover, the various parts indicated are

not suggested for use on mere theory, but not suggested for use on mere theory, but these sundry units have been tested for several months and their suitability established beyond a doubt.

The simplicity of the assembly of the instruments is not likely to be marred

except in one possible instance, namely, the making of the proper connections of the two spider web variometers or coils. This obstacle may be avoided, however, by faithful adherence to the diagram or hook-up illustrating one part of this series

Materials Necessary
The materials required are the following: One 1½-volt vacuum tube for detecting the Radiophone signals, type WD-11 being used by the Lighthouse Service; one vacuum tube receptacle; one pair of headphones; one 22½-volt B battery; one divisional battery; one 23 or 43-plate variations. dry-cell battery; one 23 or 43-plate variable condenser with vernier; one telephone condenser of .00025 mfd. capacity; one grid condenser of .0005 mfd. capacity; one grid leak; one piece of fiber or hard bristol board about 32 inch thick and 8 inches

square; ¼ pound of number 24 gauge enameled magnet wire; 7 feet of tinned copper hook-up wire or heavy bell wire; copper nook-up wire or heavy bell wire; one rheostat for controlling the filament of the vacuum tube; one piece ¼-inch diameter dowel stock, 5 inches long; one piece ¼-inch diameter dowel stock, 8¼ inches long; three or four pieces of tinfoil for covering back of panel; four binding posts; four machine screws No 6 foil for covering back of panel, four bindering posts; four machine screws No. 6, about ½ inch long, with nuts; one piece of brass, about ½ inch thick, % inch wide, and 6 inches long, for making end supports for coil shafts; three dozen copper or brass wire terminals; one dozen number 4 round-head brass wood screws, % inch long. inch long.

Materials for Cabinet

Materials for Cabinet
This homemade Radio receiving set involves the building of the cabinet as well as assembling of the instruments contained therein. Therefore, the materials for making the container are quite specific. Obtain a piece of dry close-grained wood, about ¼ inch thick, 13 inches long, and 10¾ inches wide, for the front or panel. Bakelite or other insulating material may be used if preferred. The remainder of the cabinet may be of any kind of wood, although the model receiving sets built by the Lighthouse Service is of white pine, ¾ inch thick.

ceiving sets built by the Lighthouse Service is of white pine, % inch thick.

The dimensions of the other pieces for the construction of the cabinet are as follows: Bottom and top, 14 inches by 8% inches; two ends, 8½ by 10% inches; back, 13½ by 6 inches; hinged back or door to the compartment containing the batteries, 13½ by 4¼ inches; shelf, 7% by 12% inches. The other essentials for securing the cabinet in position include four pairs of small brass hinges and screws and some 1½-inch wire brads; six brass screws, number 6, about % inch long, for securing the back in place; and soldering material.

Making the Cabinet

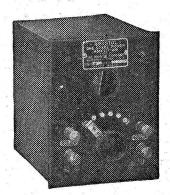

soldering material.

Making the Cabinet

The construction of the box or cabinet involves the making of a groove, ¼ inch wide and ½ inch deep, in each sidepiece near the front into which the front board or panel is slipped. Any kind of wood, about % or ½ inch thick, will do. The panel should, preferably, be a piece of close-grained wood ¼ inch thick.

THE BRISTOL COMPANY, Waterbury, Conn.

Continued from page 9)

The rheostat and condenser are put on the board, in order to be certain that the holes are in their true positions, after which the instruments are removed and the panel is put into an oven. Heat should

be applied thoroughly as a means of expelling moisture, but caution should be exercised lest the panel be scorched. While the panel is still hot, a coating of thin shellac is applied on both sides, to the edges and in the holes. The panel is permitted to dry for 24 hours, after which two more coats of shellac are applied at intervals of 12 hours. Positive instructions are issued not to paint this panel with ordinary paint; a spirit stain or water-color stain being applied if color is desired.

Applying Tinfoil

Applying Tinfoil

Once the third coat of shellac is dry, the inside portion of the panel that is above the shelf is covered with tinfoil, which object having fallen among the wiring.

then placed in position, the instruments are properly fastened, the coil shafts are inserted with the coils mounted thereon, and the tube socket is secured to the shelf.

(TO BE CONTINUED.)

Open and Short Circuits
"Open" circuits (incomplete connections) may be due to broken wires, wrong connections, or poor contacts. "Short" circuits (where an undesired path for the current is provided in addition to the desired one) may be due to touching of bare connecting wires, wrong connections, touching condenser plates or some metallic object having fallen among the wiring.

OPERATING AND TROUBLE SHOOTING

For the Owner of a

KENNEDY Model V

HE new receiving unit Model V com-bines an unusual degree of selectivity and precision with simplicity in tunand precision with simplicity in tun-ing. But, even though simplicity has been attained, the observation of certain pre-cautions named below will usually im-prove the operation and add to the enjoy-ment to be had therefrom.

also strengthened-sometimes to the point

also strengthened—sometimes to the point of being objectionable.

The simplest and most effective way to reduce such interference is to decrease both the length and the height of the antenna. This makes the set tune "sharper" although at the same time it

"sharper" although at the same time it reduces signal strength correspondingly. It is therefore wise to choose a middle course. Best all-around results are usually obtained with an aerial consisting of a single bare copper wire, number 12 or 14, suspended at a height of 20 to 40 feet and from 100 to 200 feet long. Where greater signal strength is desired, lengthen or raise the aerial; where greater selectivity is desired, shorten or lower it, or use a wave trap.

In the absence of an outdoor aerial, any one of the interior types may be employed.

ployed.

Ground

A good ground system is desirable, the best practical method being to connect a ground wire number 12 or 14 gauge,

Aerial

Almost any type of aerial is suitable, although a properly constructed outside antenna is to be preferred.

In general, it may be said that the strength of the received signal increases with the height and length of the antenna. While this is quite desirable, yet where static and other disturbing conditions are present these disturbances are tenna. While this is quite desirable, yet without a ground connection of any kind. where static and other disturbing conditions are present, these disturbances are the ground wire is attached to the an-

While a good aerial and ground system is recommended, it is interesting to know that this receiving unit operates quite well

either bare or insulated, to a cold-water pipe. Connection should be made through a ground clamp firmly fastened to pipe and soldered to the ground wire.

No. 12 of a Series Featuring Experiences of "ALL-AMERICAN" Users

No Others Equal the "All-American"

By T. J. Gehlert, Benton Harbor, Mich.

"I hooked up a two-stage radio detector and a two-stage audio frequency set using "All-American" transformers on both sides with first class results.

on both sides with first class results. The two r.f. transformers were iden-

tical. "Hearing a b o u t it being better to have r.f. transformers that were made special for first, second and third stages, I obtained a set of these of anmake but other didn't come they

And over 500,000 other radio enthusiasts will readily agree with Mr. Gehlert on this. That is why All-Americans are the most popular and most widely used of all transformers.

Audio and Radio Frequency: Power Amplifying (input and output)

More than 500,000 in use Standard on the better sets

Largest Selling Transformers in the World

"O PERATING and Trouble Shooting" is a Radio Digest feature whose purpose is to study the late models of various standard receiving sets and to show the newly initiated broadcast listener, who has purchased sets and to show the newly initiated broadcast listener, who has purchased such a set, how he can operate it to get the best there is in it and how he can overcome minor difficulties which may be causing some trouble. On pages 11, 12 and 13 this week the Kennedy V and the Garod RAF are described. Radiophans with other kinds of sets will also find these articles worth reading, particularly the notes on trouble finding.

tenna binding post. In other words, it will give quite fair results if the ground binding post is left disconnected and either the antenna or ground wire is connected to the antenna binding post.

Interference

While it has a high degree of selective.

While it has a high degree of selectivity, there are some instances where interference is so strong that it is practically impossible to eliminate it. In such cases, the following suggestions may be

Where code signals are the source of interference it will generally be found that these signals are being transmitted on special government wave lengths (within the authorized broadcast wave band) or else it may be that the signals are being transmitted above certain authorized wave lengths that could not ordi-

thorized wave lengths that could not ordinarily interfere with broadcast reception. This is almost certain to be the case if a slight movement of the tuning dial, either to the right or left, will lose or tune out the offending signal.

It is difficult to tune out a strong code signal, on any regularly authorized wave length; that is being transmitted at a distance of only two or three blocks from a receiver. Likewise, it is extremely difficult to tune out a powerful broadcasting station located within one or two miles of a receiver. a receiver.

In quite a few cases where interfer-

ence is present to an unusually marked

degree, it is possible to eliminate it by using a small wave trap connected between the antenna and the antenna binding post on the receiver. Such a wave trap consists simply of a coil having a variable condenser connected across it. The aerial is connected to one terminal of this combination, and the other terminal is connected to the aerial binding post on connected to the aerial binding post on

the receiver.

One striking fact about the use of a wave trap with the Kennedy Model V is that the wave trap does not in any way affect the regular dial settings or tuning operations.

Special Caution

Special Caution

In a majority of cases where trouble is encountered in the operation of this re-ceiver it is of external origin and can be traced either to the A batteries, B batteries, socket adapters or tubes. These will now be considered separately.

A Batteries
Since faulty A batteries form one of the most frequent sources of failure to operate, the following suggestions are of particular importance:

particular importance:

When dry cells are employed their life ranges from three to six weeks, depending on the number of tubes used and the amount of service to which the batteries are subjected each night. For this reason this type of A battery should be tested frequently. When it is found that best (Continued on page 12)

HILCO VARIOCOUPLER

Contains primary and secondary winding of the HILCO Lattice Banked type, and is ideal for use in single, two and three circuits; close adjustments in wave lengths of 200 to 600 meters; very selected. sharp tuning and variable wide range. Price \$7.00.

Specified as Standard Equipment in Erla Reflex and other well-known receiving circuits.

What a Difference the HILCO Variocoupler Makes!

Put a HILCO variocoupler or variometer in your set and note the difference! The dominant and exclusive features of HILCO induct-ance coils are—1st, lattice - bank type of winding, which suspends the wire in air with the successive turns crossing each other at right angles. (This winding possesses much greater efficiency than honey-comb and duolateral windings, and should not be confused with them), 2nd, The unique design of mounting the winding, with minimum amount of insulating or energy-absorbing material employed.

These construction features make HILCO inductance coils very selective and sharp-tuning, enabling the most distant broadcasting stations to be brought in right thru nearby stations.

HILCO Radio Products are now sold by most dealers and jobbers. If your dealer or jobber can't supply you, send his name with order and we will see you are supplied.

DEALERS AND JOBBERS: Hilco Radio Products are profitable, sat-isfactory merchandise, with quick turnover. Write for literature and

tune to wave lengths of 200 to 600 meters. Price \$2.50.

A. E. HILL MFG. CO., Atlanta, Ga., U. S. A.

OPERATING AND TROUBLE SHOOTING

(Continued from page 11)

results are obtained only when the rheostat is turned completely to the right rheostat is turned completely to the right, it is necessary to renew the A batteries. If a storage battery is used, see that it is always kept well charged and properly filled with distilled water. The battery solution should always be kept at a level

inch above the battery plates.

The ideal location for the storage battery and storage-battery charger is in the basement. Both battery and charger should be placed on a shelf supported from the first floor joists at such a height that hydrometer readings can be taken and distilled water added easily.

B Batteries

B batteries are also a frequent source of trouble. This is indicated by severe crackling noises in the headphones, unsatisfactory amplification or the necestity of setting the volume dial abnormally high to produce oscillation (the hissing sound referred to under the paragraph devoted to tuning in distant stations).

Whenever these conditions appear, it is

Whenever these conditions appear, it is well to make a careful inspection of the B batteries and their connections, including a voltage test, which should be made with an accurate voltmeter across the battery terminals. Connecting the battery terminals with a wire to see if the battery "sparks" is very bad practice and quite injurious to the battery. If the voltmeter shows that the battery is much below the rated voltage, it is probably the

meter snows that the battery is much below the rated voltage, it is probably the cause of the trouble.

Be sure that both A and B battery leads are connected to the proper terminals, + or —, because if the leads of either are reversed, the set will function very poorly or not at all or not at all.

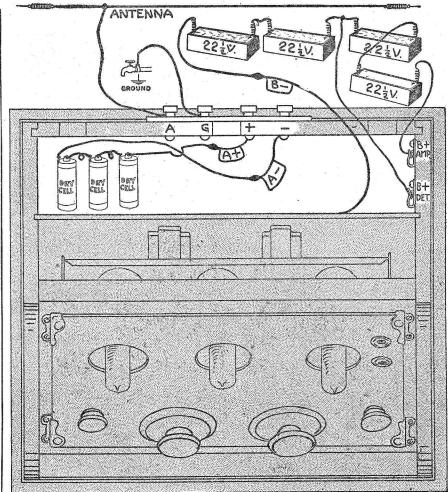

Socket Adapters

When UV-199 or C-299 tubes are used, the socket adapters may not make good contact to the tube prongs. See that the tube prongs are clean, and, if necessary, bend the adapter contact springs upward to make good contact.

Tubes

While all tubes are manufactured under strict supervision and inspection, it will be found that one of the three tubes used with the receivers is usually better as a detector than the remaining two.

For this reason it is always well to

try each one of the three tubes, succes- | quietly and gives clearer reception in gen-

Dry-battery tubes are designed pri-

marily to avoid the use of a storage battery, which in some cases may be im-practical. However, dry-battery tubes do not give quite so great volume.

Tuning

Tuning of the Model V is simple. The few operations required for nearby stations (within 25 miles) are: Plug in head-phones operates

tions (within 25 miles) are: Plug in headphones on stage 1.

Turn tube control knob 4 clockwise until tubes light up. If you are using UV-199 or C-299 tubes, do not turn any farther than necessary to light tubes. If using WD-12 or C-12, turn knob until arrow points straight up. If using UV-201A or C-301A tubes, turn somewhat past this point. Set yolume dial 2 at 30. Turn tunes, turn somewhat past this point. Set volume dial 2 at 30. Turn tuning dial 1 slowly until you hear voice or music. If signals are loud and distorted, turn volume dial 2 down. If clear, but not loud, turn volume dial up.

A small change of tube control knob 4 may now increase the volume or clear up the signal. Burn tubes no brighter than necessary for good reception. Plugging headphones in at stage 2 will, of course, give greater volume than when plugged in

at stage 1.
For distant stations (over 25 miles), For distant stations (over 25 miles), plug in headphones at stage 1. Set tuning dial 1 at 50. Turn tube control knob 4 to point previously found best for local reception. Turn volume dial 2 up until a hiss is heard in the phones. Leave volume dial at a point a few degrees above where the hissing occurs (usually about 40 to the hissing occurs (usually about 40 to 45), and find the carrier wave whistle of a broadcasting station by turning the tuning dial 1 slowly in either direction. With the fine tuning knob 3, get as nearly as possible in the center of this whistle (where it dies out but will come back when fine tuning knob is turned in either direction). Reduce volume control 2 until signal is clear.

For best results it is desirable to work

the volume and fine tuning controls to-gether at this point, by turning one with

Plugging headphones in at stage 2 will. of course, give greater volume than when plugged in at stage 1, also in this case. Finally, it is often found that advancing volume dial 2 just a trifle will strengthen signal somewhat-otherwise volume dial is left alone.

OPERATING AND TROUBLE SHOOTING

For the Owner of a

SAROD RAF

Receiver

HE neutrodyne receiver is essentially different from the more familiar types and the procedure to be used in tuning is also different.

Tubes

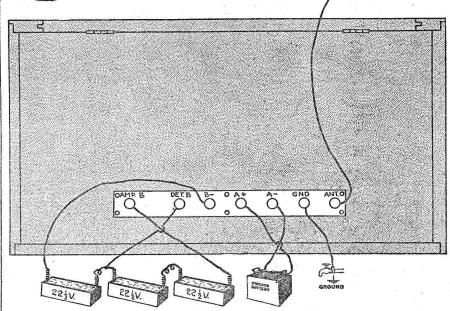

This set is adjusted for three 201-A tubes and one type 200. These tubes should be used in the sockets as follows: Two 201-A's in both sockets next to the panel, and one in the rear left socket; the 200 in rear right socket.

Better Connections

After inserting the tubes, the battery connections should be made as indicated by the markings on the panel. Ground and antenna connections should be made except when close to transmitting station. By plugging the phones in the detector jack the set is ready to tune.

Tuning

As this set does not squeal it is necessary to tune to the signal wave length rather than to the carrier wave. The two right-hand dials 2 and 3 control the wave length to which the set is tuned and these two dials tune together. For example, if it is found that one station tunes in at 45 on the second or middle dial 2, and 49 on the third or right-hand dial 3, it should be noted that there will always be a difference of four points be-

tween dials 2 and 3, it will be found a simple matter to tune in distant stations, by increasing or decreasing the adjustments of these two dials, one point at a time, and swinging antenna dial back and forth over about 10 points known to be near the correct adjustment. As soon as the station is picked up, it is

ages and different adjustments of rheo-stats 4 and 5 to determine the values best suited to the tubes used.

Renewal of Tubes

If the directions for operating the set are carefully observed, the vacuum tubes will have exceptionally long life. When the filament of a tube does burn out, however, the tube should be replaced by a new one. Use same type when ordering spare tubes or replacements.

Renewal of B Batteries

After B batteries have been in service from 8 to 12 months they become exhausted so that the signals are weak and disagreeable noises are produced. This condition may be remedied by replacing the battery by a new one.

Possible Difficulties

Anything which tends to increase resistance or decrease insulation will cause poor operation. As the batteries grow fallen out of their mountings.

6. Foor or proken connections in telephone cord or plug.
7. Inoperative vacuum tubes.
8. Glass tube resistances (grid leaks) fallen out of their mountings.

How to Take Care of the Radio A Battery

See that the connections are clean and tight and scrape off the wire or terminal connections going out of the battery so that they are bright and will form a good contact.

contact.

See that there is no acid or water spilled upon the top of the battery which would cause voltage leakage between the cells. Keep the top of the battery dry.

Keep the plates covered with water at all times. The solution should come at least ¼ inch over the top of the plates. Use only distilled water.

Do not permit the battery to stand completely discharged for any length of time. It should be recharged when hydrometer reading shows under 1,200. When fully charged hydrometer reading is between 1,280 and 1,300.

charged hydrometer reading is between 1,280 and 1,300.

In using hydrometer, see that the float does not cling to the side of the glass tube. When taking reading also see that the rubber bulb is fully expanded and not indented, as otherwise suction would permit incorrect reading.

indented, as otherwise suction would permit incorrect reading.

Remember that all new batteries are somewhat like a new automobile. They do not reach their full efficiency until they have been in service for a little while. A new battery will, therefore, not give as long service on a single charge as it will after it has been recharged a few times.

old, they decrease in voltage and increase in resistance. As the tubes grow very old, the filaments become less effective. Each fault, however, suggests its own

- remedy.

 1. Poor connections in antenna or ground wires or defective insulation of antenna.
- 2. Rheostats not properly adjusted.
 3. Batteries exhausted (indicated by low filament brilliancy, weak signals and distortion).

 4. Battery connections improperly made,
- poor or broken.
- 5. Tuning controls not in correct adjustment.
- 6. Poor or broken connections in tele-

tween these two dials. Before endeavoring to tune in a distant station, this difference should be determined on a strong local signal. Dial 1 will be found to follow dials 2 and 3, but its tuning is affected by changes in the antenna.

After determining the difference be-

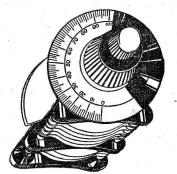

If a log is kept of the readings it will be found that the same station always comes in at the same setting, unless, of course, the transmitting wave length is changed.

After the tubes have been installed, it is advisable to try different B battery volt-

RADIO IS ALLY OF TALKING RECORDS

FANS TO HEAR PRODUCTS BEFORE RELEASE

Makers of "Cannéd Music" Suddenly Discard Old Attitude of Rivalry

CAMDEN, N. J.—Talking machine factories and record manufacturers seem to have changed their tactics and are now taking Radio as a profitable ally instead of a feared rival. Such is the conclusion one reaches upon hearing the news that the Victor Talking Machine Company has installed a new broadcasting station here, WABU, which will soon give the invisible audience an opportunity of hearing records in the making.

audience an opportunity of hearing records in the making.

That is, Radio fans will be permitted to hear original records before they are released. When famous vocalists or musicians are about to perform for the reproduction on master phonograph records in the studio, a microphone will be placed alongside the recording apparatus and as the artist renders his piece for record the fans will hear it over the air.

The Columbia Graphophone Co., in co-operation with the A. T. & T. Co., Station WEAF, is already broadcasting its latest record releases.

record releases.

record releases.

The system is likened to "first nights" at operas and theatrical productions, seats at which are always sold at a premium or distributed to the elite and members of the press. By means of Radio broadcasting, fans will now be permitted to hear new records before they are put on the market. It is a unique feature, welcomed by all receiver owners who await the advent with pleasant anticipations.

Mme. X Gives Fans a Stiff Guessing Contest

4,700 Telegrams Flood WJAZ to Tell Who She Is

CHICAGO.—Nearly five thousand listeners in joyously tackled a mystery recently when a star from the Chicago Civic Opera company sang from WJAZ, the Zenith-Edgewater Beach hotel station, under the Radio name of "Madame X"

X."
"Who is Madame X? Guess and send "Who is Madame X? Guess and send us a telegram," the announcer requested after the opera star had sung "Annie Laurie," "The Last Rose of Summer," and, finally, "Caro Nome." The flood of telegrams that followed nearly paralyzed the telegraph companies. A total of 4,700 Macbeth.

Instructions for Use.—All the hours above are given in Central Standard Time. If your city uses Eastern Time, add one hour to each of the periods stated; if your city uses Mountain Time, subtract one hour; if your city uses Pacific Time, subtract two hours. This table includes only the evening broadcasts, and on Sunday, the late afternoon program.

telegrams had arrived up to the time the broadcasting station lost count. They came from north, south, west and east—as far away as Portland, Ore.

Forty-six percent of the guessers guessed right. The singer was Florence Macbeth.

No More Shocks

in Using the New ALWELL Wooden Handle Soldering Iron

THE Alwell soldering iron, with its handle made of wood, affords the greatest boon to the builder of sets from the sudden and ruthless electric shocks often received from metallic irons. Built substantially of good material, furnished with either the small or large point, and equipped with standard cord and plug, Alwell is long lived and very serviceable. Above all, it offers one of the biggest bargains in Radio at

DEALERS We have a money-making DEALERS proposition on FULTONE for you. This loud speaker, because of its quality at such a low price, is destined to be the biggest saler in Radio. Better wire today. Prompt and immediate delivery assured.

King Miloplex Turns Out New Trick Circuit

Part XIX—Modified Wizard Miloplex Described

By the Mystery Man

The wind is blowing, And it is snowing, And I am going HoEm.

HICH is proof positive that all you have to do in order to write heart-rendering poetry is try and sell it. But, really, truly, the above windlet came

Ever since the Wizard Miloplex came out in your magazine, I have been a strong advocate of the circuit. I originally built it as a one tube set and the results were better than I had hoped. I rebuilt it as a three tube circuit a couple of weeks ago after having heard over fifty staions on the one tube. My list then contained at least three in California, some 1,900 miles from here. Since the three tube set has been working I have raised my list to over eighty stations and am still gathering them in at the rate of four to six a night. Last silent night I was quite successful and up to midnight, when I "signed off," heard 35 stations, eastward to the Atlantic coast, westward to Denver, and from Texas to Ontario and Saskatchewan, Canada. My set is run on WD-11 tubes and is exactly like the original hook-up, except that I put a 1,000-ohm phone coil in series with the primary of the first transformer. It wouldn't oscillate correctly until I did. The wave length range of the stations received was from 254 to 545 meters. Could a neutrodyne beat it?

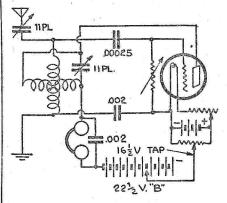

Yours very truly,

Yours very truly, Henry F. Dever, Wilmette, Ill.

drifting in as I was trudging home after cussing and discussing the printer because he didn't show some speed in get-

"Course, as Maggie says, "It was awfully sweet of you," but man, oh, man, I said just fix it so I could still eatnot a banquet. Let's eat is my motto; then I'm sure, unless there's some comthen I'm sure, unless there's some com-pany or a dude at the table whose chest measure is the same as mine but with a longer reach.. Well, it's all there; why pass it and waste so much time? But, anyway, you fellows fixed it—I'Il say you did! Can I stay home—can I eat? I'Il anyway, you reflows fixed it—I'll say you did! Can I stay home—can I eat? I'll say I can; listen, the very day your post cards reached the 3,000 mark she let a chicken wink at a pan of hot water and we had chicken soup—and it was fine. Then I brought home a chicken that I was going to teach how to wink and Then I brought home a chicken that I was going to teach how to wink, and Maggie nearly made soup of her (you know what I mean). Oh, well, it's all according to where you get your chicken. Certainly! Don't you 'spose I now know that the guy who wrote "Fine feathers make fine birds" never was a cook. He got all of his training listening or peeking at a lace counter.

ing at a lace counter.
I've noticed a slight change, though, ir I've noticed a slight change, though, in Maggie since she received, or got—no, it's received—all those cards, a sort of motherly tenderness, not quite so much rolling-pin attitude. Why, only yesterday at dinner—well, call it supper—anyway as we were eating at six bells, she said: "Don't you wish for another cup of coffee," and I told her I wouldn't.

be right than president and she's both, so I guess this is going to be a bad year in our family—especially when you live in a stingy neighborhood and no cellars.

WhichIs Best Miloplex Circuit?

And now that you know just how things are at home, please permit me for the first time to step out of the "Mystery Man" character for a moment to answer a most insistent question—sort of from-the-ridic-ulous-to-the-sublime change.

Hundreds of letters have come to me asking which of my three circuits is the best for the average fan to build who cares nothing about experimenting and who wants to be cock-sure that the circuit will stack up as "A number 1," not a trick circuit exactly but one that is stable and has enough refinements in it to make and has enough refinements in it to make

it well worth while building for keeps.
Friends, listen! If I was going to build one just to please everyone, I'd build two one of them a three-tube regenerative, the

ting the photo out for you, "My Gang"; you, now over 5,000 strong who wrote Maggie. Yes, and you fellows who sent her candy n'everything. Make him work, keep his nose to the grindstone; rope and hogtie him. Yes, all of them kind wurds and more, too, that's what you fellers wrote her.

'Course, as Maggie says, "It was awfully sweet of you," but man, oh, man, I said just fix it so I could still eat week, two stages of audio amplification; then rest a while, and if enough of you want a real "He" four-tube circuit that has a power amplifier idea in it, I will see that you get it. But build this one anyway; it will well be worth your time and make a lot of sets sit up and take notice. What is it? Nothing more or less than the "Wizard"—yes, the one some of you passed up—the real Wizard Miloplex with one or two slight modifications.

The Wizard Miloplex Medified

Same old split variometer—and you know now, I don't like moulded ones—same old socket, rheostat, potentiometer and everything. But, it's got more kick than—well, build it you fellows who passed it up because it was too easy. Refining some of the "old ham" timers very often gives you a surprise on volume and DX.

I've made a very important B battery.

and DX.

I've made a very important B battery change, also a doubly important variable condenser change, and if you will cut your five-ton aerial down to a single wire around 100 feet long, I am quite certain you will be surprised.

Note particularly that the variable condenser in the antenna is an 11-plate.

Note particularly that the variable condenser in the antenna is an 11-plate affair, though you may in a pinch use a 21-plate but no larger. While the 11-plate is better, again watch very carefully and note that the connection from the center post of the potentiometer goes to the 16-yell. It are not your P. bettern. to the 16-volt + tap on your B battery; he 22½-volt + connection on your B battery goes to phones, and be certain to try first one, then the other of your phone cord terminals on this + 22½-volt tap. Considerably greater signal strength will result from the proper terminal and besides, you will also avoid the possibility of slowly demagnetizing your phones. Be certain to connect the rotating plates of antenna condenser to antenna side, and make your lead from grid condenser short, yes, very, very short. Don't make square

QUIZ R.C.A. MONOPOLY

(Continued from page 2)

following countries, or with concerns in

following countries, or with concerns in control of the situation in those countries: Norway, France, Germany, Poland, Sweden, Netherlands, South America, Japan and China.

Arrangements have also been "perfected" by the R. C. A. with the land telegraph companies (Western Union and Postal Telegraph) whereby messages will be received at their offices.

How R. C. A. Was Born and Nursed Along'

A summary of the contracts between the respondents as recited in the Federal complaint is (1) the organization of the Radio Corporation of America in 1919, under the supervision of the General Electric Company which company received large holdings in the stock of the R. C. A. for capital supplied and for its service in connection with the acquisition of the

American Marconi Company.
(2) An agreement entered into between (2) An agreement entered into between these companies granted to the Radio Corporation an exclusive license to use and sell apparatus under patents of the General Electric Company until 1945; and the Radio Corporation grants to the General Electric Company the exclusive right to sell through the Radio Corporation of to sell through the Radio Corporation of America only, the corporation agreeing to purchase from the General Electric Company all Radio devices which the General Electric Company could supply. (Later this arrangement was extended to in-

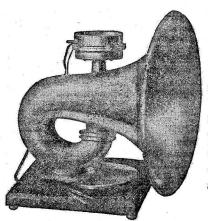

clude the Westinghouse Electric & Manu facturing Company, the business of the Radio Corporation being apportioned be-tween the General Electric Company and the Westinghouse company; 60 percent

going to the General Electric and 40 percent to the Westinghouse company.)
(3) Meanwhile, in July, 1920, the General Electric Company and the American Telephone & Telegraph Company made an Telephone & Telegraph Company made an arrangement for mutual licensing on Radio patents owned by each. This provided for certain traffic regulations. The terms of this agreement were then extended to the Radio Corporation of America and the Western Electric Company, and thereafter to the Westinghouse company.

How United Fruit Was Invited In

The Radio Corporation in March, 1921 made an agreement with the United Fruit Company (which operated a number of commercial Radio stations in Central and South America), by which licenses under the Radio patents of the Radio Corporation and of the United Fruit Company (and its subsidiary, The Wireless Specialty Apparatus Company of Boston) were exchanged and arrangements made for the exchange of traffic facilities. The definition of the respective fields of the Radio Corporation and the United Fruit Company was adopted and provisions of the agreements between the R. C. A., the General Electric, American Telephone & Telegraph and the Western Electric companies made an agreement with the United Fruit graph and the Western Electric companies were also extended to the United Fruit Company.

Acousticola Grand

\$35<u>∞</u>

Highest quality Loud Speaker made. CAST ALUMINUM vibrationless horn, extra large and sensitive unit. Adjustment lever tones down local stations and strengthens weak signals from distant stations just like focusing a camera.

LEADERS IN TUBE ECONOMY Voltrons set a mark of highest quality in tube manufacture. Only the most skilled workers were employed, the most scrupulous tests resorted to. Yet Voltrons sold for considerably less than other tubes. They led in price reduction. They will continue to lead in quality and economy. All Tubes One Price

Powerful Set Wanted

Simple Hook-Ups Desired but Are Not Heart of Set E VEN the mightiest of the mighty is threatened by newcomers in Radio. Revolutions in this science are occurring so fast that the bystander can do nothare occurring so fast that the bystander can do nothing but give way and have patience for the final outcome. There is no use in taking part, no advantage in deciding on a certain receiving set for one's own amusement. For tomorrow that set may be overthrown by another, simpler and better. Such are the uncertainties of a revolutionizing science.

That Radio is in a state of turmoil, of constant thenge and uncertainty has never been so attested as

change and uncertainty, has never been so attested as it is now. Today a "super set" is hailed as the latest achievement. Tomorrow it may be out of date.

The simple hook-up will come, but only through those necessary parts which cannot be made by persons that can just solder a wire.

Operations Must Be Learned No Definite Instructions Can Be Given

O definite laws regarding Radio communication can be laid down by the scientist and authority, as a great many fans have learned by experience. There are too many factors, of which little is known, involved in the operation of this newest science. The questions of static, fading of signals and interference, each of these a problem in itself, are always present to handicap the authority when he attempts to set down certain rules and laws for the fan to follow.

There is nothing definite for the fan to go by in Radio communication at the present time. The only way he can tell is by installing a receiver and experimenting with his antenna and ground system until he achieves perfect reception. It is entirely useless for him to write to an expert hundreds of miles away and ask him how for a certain type of receiving set will ask him how far a certain type of receiving set will reach when installed. The expert cannot tell him. He may advise how to install the set properly to get the best results possible under the local conditions, but that is as much as he can do. The rest is up to the

Amplification and Interference Necessary Things for the Future of Radio

WHEN the telephone and telegraph first came into we their advent was hailed as "annihilating space." Yet we realize that we never knew the meaning of the term until Radio broadcasting began. Radio has proved the real space annihilator.

Radio telephone conversations have been held be-tween New York, Paris and Honolulu. News of the greatest disaster of modern times, the Japanese earthquake, came to the rest of the world by Radio.

In 1897 Marconi made the statement that dispatches

by voice could be sent 20 miles and said he was speak ing within practical limits. The distance depends upon the amount of exciting energy and the dimensions of the conductors from which the waves proceed.

But amplification has upset all his calculations. The range of modern Radio communication is the result of amplifying or multiplying millions of times the electrical energy at the broadcasting station and again at the receiving station when it is changed back to sound

energy.

In all probability, the biggest development in Radio in the immediate future will be among the farmers and those living in small villages and towns. Putting these families in touch with what Radio has to offer will enrich and expand rural life to a greater degree than

even the automobile or the telephone.

Every family in the land contains potential Radiophans, and two factors especially point to the possi-bility of a Radio development which may eventually mean a set per family in the United States. One is the fact that amateurs need not buy expensive sets, but by a little ingenuity can build their own sets. They get good results, save money, and have a lot more fun building their own than in buying them. Their chief need is caution to buy only reliable apparatus. The transformer is the heart of the set, and this must be of reliable manufacture. We have interference to contend with at present, but progress is being made in this direction and soon this will not retard develop-

this direction and soon this will not retard develop-

RADIO INDI-GEST

Our Own Idiotorial

Now WE want an inning. We demand an inning. We must have one so we will take one. All our We must have one so we will take one. All our contemporary column conductors take an inning now and then, so, "Why not I with thine?" Let's consider. Up to the time of going to press, 1,793,485.026 cartoonists have abundantly filled the daily press of this country with cartoon strips featuring two jokes. It wouldn't be so bad if they'd vary it just a little bit and hop on a couple more of the old standbys, but why in the name of Marconi must these strip artists continue their incessent repetition? But WE will have

continue their incessant repetition? But WE will have revenge! We shall BAR the two offending, malodorous

Hear ye, hear ye, ye aspiring literati who contribute to our column—the story relating to the man with the ear muffs being taken for a Radiophan by a child and the pun coupling up the opening of a window and cold air with a Radiophan having received a South American republic, are hereby irrevocably barred from appearing in our column. We DARE you to send us any thing based on similar premises.

When We Had the "Willies"

When Willie was a little boy, He had such fiendish ways. If we had company at our house, 'Twas one of his off days.

He'd be so good and play so nice,
When we were all alone,
But just when folks were sittin' 'round,
That boy we could disown.

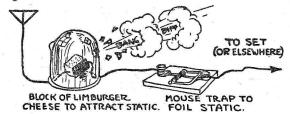

Time went on and it came to pass, Another "Willie" came to us, Who ran absolutely true to form, With howl and wail and fuss.

When all alone we'd tune in fine,
And get all stations clear,
But when strange folk would call at night,
There wasn't one we'd hear.

So both we called by that same name,
A contrary pair were they,
But now a good set we have got,
And son's outgrown his way.

Static Aid from Switzerland

Dear Indi: All this hokum pokum about wave traps hasn't even a butter knife's edge on my Shure Shot Static Trap. For the benefit of humanity I will disclose the details of my brain child to the world through your valued medium. Photograph is given herewith. The cheese not only attracts the static, but has been known to set up its own atmosphere, thus preventing the external atmospherics from atmosphering

Then as a side issue, the holes often intrigue the static noises into the puzzling myriad of their complexities, thus losing them forever. The mouse trap, when the cheese fails, pins the sky crackles to the base, at the same time it opens the antenna circuit wide, in fact tog wide for any self-respecting static to jump. Your welcome. V.L.J.

Whereto? Galena, Illinois?

Dear Indi: Noting the unceasing inquiry as to my whereabouts and the untiring demand for my souper touch to valuable kinks, I feel duty bound to send in another, so heregoes. The subject of my lecture this evening will be, "How to Make Your Crystal Set Cover Any Distance You Desire."

Lecture.—Hop a train and take your set there.

CAPACITY JACK. P.S. Am sending you hunk of coal which at present market prices is worth well over \$001.00. Handle it carefully so as not to get dirty.

C. J.

Here's One 3,000 Years Old

Dear Indi: Howzis?

King Tut had a Radio set,
It cost him fifty annas
But all the music he could get
Was "Yes We Have No Oranges."
PHIL A. MINT.

But Did He Get Cuba?

Dear Indi: A fellow in our town (the usual way to start) was robbed the other night as he sat at "Old Faithful," his Radio set. The newspaper reporter found that the following conversation had taken place:

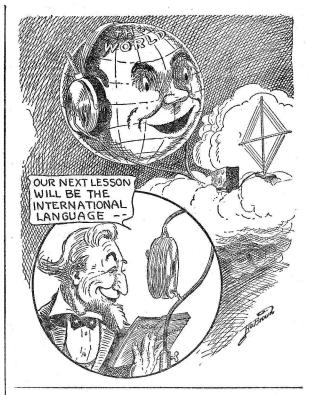

Burglar: "Stick 'em up! No fooling, now, or—"
Radiophan (frantically): "Sh-h-h-h! I've just tuned in Havana, I think. Take anything you want, but SHUT UP!"

MAMA HAYMES.

But They Were Martyrs to Science, C. M.

Dear Indi: When the Shenandoah lost her nose thousands of Radio sets lost their "innards." When the great ZR1 sent its Radio SOS, broadcasting ceased without warning, except at ten-minute intervals when announcements were made concerning the big dirigible's position. Hundreds of thousands of sets were being used. One man I know went to sleep with the headphones on depending on the announcements to swaken him ments to awaken him.

think of the thousands of poor, innocent Radio sets that were tuned in during one of the silent intervals. Many a silent set was placed on the operating table that night and dissected mercilessly to locate an absent trouble.

Condensed

By DIELECTRIC

Since the special attempt was made to reach across the Atlantic via Radiophony by England and the United States, a greatly increased interest has been manifest on the part of British listeners in to distant reception. They are equipped with several relay stations the business of which is to rebroadcast programs from other countries for the benefit of local fans. Many of our stations are heard with considerable regularity over there and by a large part of the Radio audience, due to this means. Why could not a similar stunt be put on for American listeners at some specified time, just to let them hear what is going on over there?

In conversation with a nurse recently I was informed that her observations of patients having access to a Radio receiver convinced her of its efficacy in relieving sufferers, particularly in cases of mental distress. In this instance a receiving set had been given the hospital where she is employed. Take, for example, the Arnold home for aged men in Detroit, Mich., where the installation of a receiver has brought new life to men whose outlook must be dreary at best. Is there any reason why those who through affliction must spend a part, or all, of their time in an institution would not appreciate hearing all the things that only Radio can bring? What are you doing in your community?

No matter to what political party you vow allegiance, Republican or Democratic, the proceedings of a national convention. May be we won't want to again, but this is to see how few men can pick the candidate you and I shall vote for. Of course, if the newspapers give you all you care to know of what takes place among the all you care to know of what takes place among the hundreds of delegates chosen (ostensibly) to represent you, perhaps the news of both parties contemplating broadcasting their big meetings will not make your dials more alluring. It is very likely, however, that immense audiences of listeners in will be all set to catch every sound coming from the "mike" set up in Public Hall, Cleveland, and from Madison Square Garden, New York City. Lots of us never heard a political convention. May be we won't want to again, but this is something entirely new in Radio. is something entirely new in Radio.

"It's the same old thing no matter what station you tune to, songs, jazz and crop reports!" Is it? I will readily admit that some of the popular songs have become less popular, due to much repetition; jazz—well, you read the verdict rendered by the listening Radio public; as for the crop reports, they are given but seldom through the day and then not from all broadcasting stations. Was the battle in the air between the ZR-1 and the elements, so dramatically described through WOR, another of those commonplace features? To anyone listening to the announcer asking his unseen auditors for information about the huge airship and, later, giving location and proffers of aid airship and, later, giving location and proffers of aid to those on the dirigible, certainly thrills were not lacking. It is the unexpected which makes Radio reception so fascinating a thing.

If you have not too recently joined the clan of Radiowill be easy for you to recall the time when colleges had not realized the contribution they might make to educational advance in broadcasting lectures given by members of the faculty. Now, this Radio specialty has found a place in the regular programs of many studios and transmitting apparatus has been installed in a number of the colleges of the country. I know of one instance where the rapid strides in mastering correct use of English, by the aid of a professor's broadcasted lectures, enabled one listener to advance more quickly than would otherwise have been the ease. An effort is now being made to have the the case. An effort is now being made to have the authorities include the study of Radio in the scientific curriculum of the University of Pennsylvania. It would seem entirely logical to have all educational institutions including scientific courses of study adopt Radio as a subject.

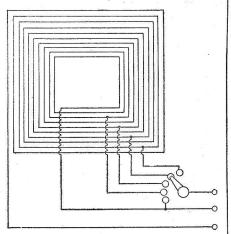

How and Why of Super-Heterodyne Receiver

Chapter IV—Loop Aerial and Circuit

By H. J. Marx

ITH the completion of the super-audible transformers and the oscil-lator, the fan is prepared to start work on the assembly of his set.

Many are no doubt wondering why there are three input terminals on all the cir-

cuit diagrams and how the connections are to be made. With super-heterodyne are to be made. With super-heterodyne circuits, owing to their ability to pick up weak signals, it has not been necessary to use an outdoor antenna. The loop aerial is amply efficient and by its directional effect makes the best type of energy cellector.

Loop Aerial Details

Toop Aerial Details

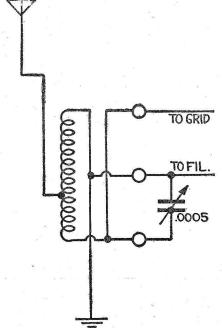

In the illustration is shown the connection details of a loop aerial. This loop consists of 10 turns of wire, stranded preferred, wound in the form of a single-layer inductance, on a framework 2 feet square. The turns should be spaced ½ inch apart. The two outer ends are connected to the two lower terminals, as shown in the diagram. This shunts the 10005-mfd. variable condenser in the input circuit across the loop for tuning. The tapped switch is connected to the top or grid terminal of the circuit. This tapped connection is made at every second.

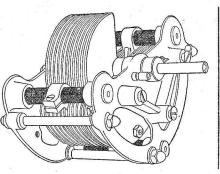

turn and permits a variation of the actual energy thrown on the grid.

This variation of energy thrown on the grid is of decided importance in improving the efficiency of reception.

Outdoor Antenna

For cases where the use of outside aerials are desired, the usual method of connecting the tapped secondary of an air core neutrodyne transformer is recommended. This method is shown in the

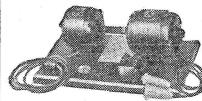

be of the highest quality obtainable, with low leakage losses and also low resistance value. Naturally the minimum capacity should be as low in value as possible. Two condensers of this type are shown in the illustration. These are by no means the only ones available; a number of others are about to be placed on the market. The two illustrated, however, show to best advantage the type of construction which is characteristic of high efficiency design.

Seven-Tube Circuit

The large illustration shows a seventube super-heterodyne circuit using two stages of neutralized Radio frequency, (Continued on page 26)

RECHARGE YOUR OWN BATTERIES

Save Your Batteries, Time and Money

A REAL Motor Generator Set

Designed and perfected to fill the need for an outfit that will give positive, dependable, lifetime service. It will quickly recharge any three-cell automobile or Radio "A" battery, even when completely exhausted or badly sulphated. Operates quietly, recharges in one-third time usually required and cannot charge in wrong direction, no matter how connected.

SPECIFICATIONS

Capacity, 6-10 volts, 3-20 amperes; automatic; needs no watching while charging. Cannot be injured by accidently short-circuiting generator leads.

Ball bearing Ohio Motor and Generator will run quietly and smoothly thousands of hours without further oiling.

Equipped with ammeter and rheostat to consultations.

Total charging rate. Long leads permit plugging in practically anywhere.

Made of best materials; well finished; mounted on substantial base; weighs 60 pounds.

Regularly equipped with 110 v., 60 cycle A. C. Motor; 6-10 volt Generator.

Equipped for other service if desired; prices on application.

For Full

Ask us why a good motor generator set is the only real way to charge and keep your batteries in condi-PARTICULARS tion and how it will save you money, time and trouble.

Made by one of the leading electric motor manufacturers of the country.

Phantom Circuit

The hook-up shown has proved very satisfactory. It gives louder signals on CW and phone transmission than by using the regular antenna and coupler. In the illustration C¹ is a variable condenser of .001 mfd. and C² is a .0005 variable condenser. A fixed grid condenser can be

used, but a variable one is much better. The coil L is about 54 turns of Number 22 wire, tapped in nine places, or every six turns. The tuning is done with the switch and C, while C² controls the oscillations. If an amplifier is connected, of the transformer in the place of the phones.—Elwyn C. Woodworth, Rochester,

KING MILOPLEX

(Continued from page 17)

turns in your wiring. The shortest distance between two points is a straight line. Run your wiring as short as possible—never mind hew it looks. This animal you are building is for listening, not looking, and it's worth two tricks if you have a panel mount socket so your verible. use a panel mount socket so your variable grid leak can be close at hand and close to the socket also.

Operation of Wizard

In operating, turn on filament rheostat just to the ragged edge of the hiss point, then throw the dial out the window—well, then throw the dial out the window—well, all right, keep it if you will promise not to go beyond that very slight hiss point.

Never mind whether you think the condenser across the rotor is working or not. May be I know or I wouldn't use it, and no—it doesn't tune your plate.

Use an open work closely coupled variometer; yes, about 60 turns on both rotor and stator; get a soldering iron that works and sweat the joints. If you don't know how to sweat a joint when soldering, then have nerve enough to ask a tinsmith.

then have nerve enough to ask a tinsmith.

then have nerve enough to ask a tinsmith. He knows.
That's about all, except if you use dry cell tubes the potentiometer should have at least 1,600 ohms resistance, and your plate B voltage as marked on the tube carton. If storage 6-volt battery, then a potentiometer of around 200 ohms will do. Let's eat.

(TO BE CONTINUED.)

Ground Connections

What is the best ground connection? true. It ought to be the cold water pipe, and there must be a ground clamp, with the wire soldered to clamp. The larger the ground wire the better. Copper braid or ribbon is better than wire. The ground wire should be supported on insu-

Simple Explanation of Radio for Everybody

Chapter X—Part II—Loud Speakers

By M. W. Thompson

THE following article is the twentieth of a series for Radio beginners, written by Marvin W. Thompson, well known in airphone circles for his understandable style of approaching his subject. The remaining chapters will be:

Chapter XI-Dry Cells and Storage Batteries. Chapter XII-Radio Frequency Amplifica-tion.

HE perfect diaphragm, or one that would be sufficiently good for most of us, would have an intensity curve like that shown in Figure 78. For notes like that shown in Figure 78. For notes below 50, the efficiency would be gradually rising and it would reach maximum on notes around 100. The intensity line would be flat to notes around 5,900, after which it would drop to zero at 6,000. True, some of the higher harmonics of the upper fundamentals would be lost, but reproduction would be most satisfactory. Unfortunately, due to the increasingly dispersionally. notes around 100. The intensity line would be flat to notes around 5,900, after which it would drop to zero at 6,000. True, some of the higher harmonics of the upper fundamentals would be lost, but reproduction would be most satisfactory. Unfortunately, due to the increasingly discontinuately, due to the increasingly discontinuated be flat to notes around 100. The intensity line would be first multiple, or 3,500.

The small chamber behind the diaphagement of the horn also a marked weakening on the first multiple, or 3,500.

The small chamber behind the diaphagement of the horn also affects that mainly upon the volume of the inclosed at that point and also a marked weakening on the first multiple, or 3,500.

Shape of the Horn

The shape of the horn also affects that which comes out. Every curve and corner, twist and surface on the inner side

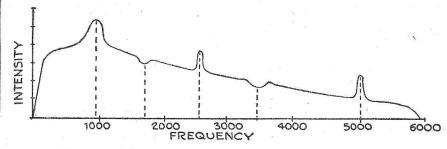

Figure 79-The diaphragm response is usually as shown here, the natural period being at 990 cycles.

nant to any of the frequencies found in the musical scale, is not completely dead and lifeless.

Unusually rigid material, such as stone

Unusually rigid material, such as stone or thick metal or compositions made of wood fiber, gives the best results. If the walls of the horn are smooth and rigid, they produce no appreciable effect upon the tone. If, on the other hand, they are rough or flexible (resonant), they may absorb or rapidly dissipate the energy of of the air vibrations at certain frequencies and thus, by subtraction of certain barof the air vibrations at certain frequencies and thus, by subtraction of certain harmonic overtones, have a marked influence upon tone quality. This would inject depressions or valleys into our curve of Figure 79 and make it appear as in Figure 80. A resonant point on the 1,750 notes will give the depression noted at that point and also a marked weakening on the first multiple, or 3,500.

Shape of the Horn

The shape of the horn also affects that which comes out. Every curve and cor-

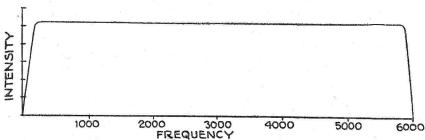

Figure 78-The efficiency curve of a perfect loud speaker would show equal response at all frequencies

vided response on higher notes, the curve for even the best present-day loud speakers looks much like Figure 79. The peak at about 990 is due to the natural frequency of the diaphragm; those at 2,500 and 5,000 are due to certain harmonics at which the diaphragm vibrates well. The intensity, for the reasons given above, falls off and there is a pleasure-wrecking weakness of there is a pleasure wrecking weakness of the high notes and a flat shrillness to them due to the elimination of their harmonics. The elimination of the diaphragm with the necessary substitution of some

POWER AMPLIFYING TRANSFORMERS

Price per pair, \$13.00

The new Thordarson Power Amplifying Transformers (push pull) are designed for use as third stage audio frequency amplifiers, to provide high power amplification for operating loud speaking devices.

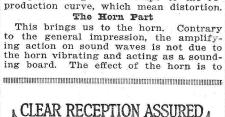

With power amplification, not only is it possible to increase volume, but, since two tubes replace the usual one, the distortion and howling which usually accompany the overloading of a single tube on the third stage is done away with entirely.

The Thordarson Power Amplifying ransiormers are well constructed electrically and are capable of indefinitely carrying the additional load without breaking down.

In tonal purity these transformers equal the Thordarson Super Audio Frequency transformer whose rich quality and even amplification has made it the popular transformer of the day.

The Interference Problem in Radio

By E. F. McDonald, Jr., President of the National Association of Broadcasters

N ANALYZING the Radio interference situation at the present time, it should always be remembered that while broadcasting is of paramount importance to millions of people throughout the country. try, there are other phases of the Radio industry which must be considered and upon which depend much of the commerce of the world. Trans-Atlantic and ship-to-shore Radio traffic are of vital impor-

The work of the serious Radio experi-menter is also of the highest value in furthering the advancement of the Radio art. In order that the broadcast listener may get the most out of his receiver, a thorough knowledge of the causes of the interference which he occasionally experiences, together with the various means available for their reduction or elimination, is essential.

Two Most Frequent Causes of Trouble

There are, of course, various types of interference occasioned by different causes. The two most annoying at the present time are telegraph code interferences from ship and shore stations working on low wave lengths of around 450 meters, and the reradiation of receivers of improper design or improperly operated by unskilled users. It is to the interest of all participating in the Radio industry to assist in correcting these conditions as well as the other causes of interference.

The National Association of Broadcast-ers have conferred with Secretary of Commerce Herbert Hoover on the subject of ship interference, and through his efforts and co-operation are arranging for international regulations providing for the carnational regulations providing for the carrying on of ship-to-shore traffic on wave lengths outside the broadcasting band. This article, therefore, deals only with the interference created by re-radiation from Radio receivers.

Legislation Cannot End Bad Conditions It is a popular fallacy that all that is necessary to put a stop to any undesirable condition is the passing of legislation. Unfortunately this idea has occasionally taken root and grown into something that constitutes a real menace at the heart of our American civilization. There is nothing more detrimental to the morale of a nation than the adoption of legislation which is obviously impossible of enforcement and which, through the ease with tach it the moment he left. The enforce-which it may be ignored, teaches whole-sale disrespect not only for the law but dered extremely difficult because of the

sale disrespect not only for the law but the authorities that make laws.

We have, at the present time, no better example of an "iron-clad" law which, so far at least, has been impossible to enforce, and which has possibly worked a greater evil than that which it was designed to eliminate—than the prohibition amendment amendment.

Patriotism Only Successful Force in War During the war the navy department undertook through its intelligence service to prohibit the use of transmitting and receiving apparatus throughout the country. The prohibition on transmitting was comparatively easy to enforce, but, not-withstanding every effort to eliminate re-ception, in the final analysis it came down

simply and squarely to reliance on the loyalty and patriotism of the individuals

which go to make up our great nation.

Obviously the individuals who really desired to use Radio for ulterior purposes had no such sense of loyalty, and as a consequence, to a great extent, all that was accomplished was the prohibition of the use of receivers in the hands of those who would not use them in any case to the disadvantage of the country, whereas it was practically impossible to stop the use of such apparatus in the hands of those intent on serving their own ends.

Adopted Legislation Could Not Be Enforced For these reasons, the adoption of legislation prohibiting the use of receivers which feed back energy into the antenna is obviously absurd. The adoption of an act of this kind would be comparatively easy, but the enforcement would require a reacter force of officers and special agents easy, but the enforcement would require a greater force of officers and special agents than we have at the present time attempting to enforce prohibition. Certainly our government cannot afford such an expenditure even if it were possible to completely

eliminate re-radiation by such means.

It should be remembered that, in the first place, the locating of the offending receivers which feed back into antennæ would be comparatively difficult, and even were they located, it would be a simple matter for the user of a set of this kind to disconnect the tickler coil, or whatever means was used to feed back the energy, while the inspector was present, and at-

ment of any such act would also be rendered extremely difficult because of the statutes prohibiting the entrance of private dwellings without proper search warrants.

The Solution to the Problem

Granting that the feed back from receiving sets is harmful and that preventive legislation, if not impossible, at least is impractical, what is to be done?

Obviously the solution to the problem is constructive action on the part of the Radio manufacturer. At the present time the laboratories of eight of the largest manufacturers of receiving apparatus are at work night and day on the production of a simple device to be connected ahead of receivers feeding back, which will not allow the passing of this energy out to

the antenna. Such a device, when developed and perfected, will be put on the market by the manufacturers, according to an agreement among them, at practically actual cost, so that the users of all types of sets will have the benefit of the device without undue expense.

It is not fair or reasonable to expect the users of feed back receivers to junk and throw away apparatus representing the investment of many hundreds of thousands of dollars, when by the addition of some simple device the re-radiation can be entirely removed and reception improved.

The public will not be hard to persuade to use a device which will cost little and which will not only through reciprocity eventually eliminate all feed back howls,

Reflexing Four-Tube Neutrodyne Receiver

Inserting a Crystal in the Popular Circuit

By H. J. Marx

HERE have been a number of efforts to discredit the possibility of using the reflex type of circuit in conjunction with the neutrodyne principle. No real reason exists, however, why the neutrodyne circuit should not be reflexed, and this without loss of efficiency but retaining the gain accruing from the elimination of one tube.

More Volume

A number of fans have stated that they would like a little more volume from their five-tube neutrodynes. This article is primarily intended to detail the changes necessary for reflexing one stage of the audio frequency and then using the fifth tube for an additional stage of audio frequency amplification.

if desired.

Naturally, if only one stage is reflected, the fan will have no trouble in construc-tion and operation. It is only when two stages are reflexed that we meet the more stages are renexed that we meet the more serious problems of tube efficiency, proper by-pass condenser values, interference in leads, oscillation control of the tubes, and the ratios of the transformers. Few fans have had trouble with single-tube reflex circuits; it's the multi-tube reflexes that cause the gray hairs.

Making Change on Five-Tube Set

In making the change on a five-tube set, the lead between the plate of the second

The additional parts required are one tube and the third neutroformer is opened audio frequency transformer and a few by-pass condensers. Jacks can be added former is connected in series, with a .002 if deciral transformer is connected in series, with a .002 in the connected in series and the connecte and the primary of the extra audio transformer is connected in series, with a .002 condenser across it. The secondary of this transformer is connected to the grid and filament of the fourth tube. The secondary of the audio transformer, after the detector tube is connected in series with ondary of the audio transformer, after the detector tube, is connected in series with the grid return of the secondary of the second neutroformer. A by-pass condenser is then added from the neutroformer filament terminal to the negative battery lead. This then completes the alterations for reflexing one stage.

Four Tube Set

For those fans who want a four-tube set the last tube can be eliminated. This gives a very efficient receiver that meas-

ures up well with any five-tube neutro-

Heavy Wire Used

In circuits where a single turn of wire constitutes the primary inductance, heavy wire should be used, preferably number 12 or 14. A strip of copper ribbon, ¼ inch wide and properly insulated from the secondary, will serve very well.

SUPER-HETERODYNE

(Continued from page 21)

two stages of super-audible amplification, two detectors and the usual oscillator.

The oscillator should be shielded from The oscillator should be shielded from all the remaining parts of the circuit. The grid and plate leads should avoid all proximity and parallel runs to any other leads in the circuit. Shielding should be of brass or aluminum plates. The super-audible amplifying stages should likewise be well shielded from each other and the remainder of the circuit. Their grid and plate leads need careful attention to avoid losses and uncontrollable oscillation of the tubes.

If a lead must run in some direction where interference is obvious, cover the lead with spaghetti and slip some copper or brass tubing over it, then ground this tube. Be careful that the tubing does not touch the lead, however.

Shielding reduces the volume but eliminates interference and improves the clar-

Shielding reduces the volume but eliminates interference and improves the clarity of reception. When properly applied, it eliminates all capacity effects. The slight loss in volume can be restored by the addition of audio frequency amplification if necessary.

An ideal panel size for a set of this description would be about 12 by 30 inches. The cabinet should be about 12 inches deep. The cabinet and panel can be entirely lined with metal shielding. Metal partitions can then be used to further subdivide the interior for the various stages.

Condensers should be set back about

Condensers should be set back about 2 inches from the panel, and shaft extensions added.

Consistent coast-to-coast reception can be expected from a properly designed, well constructed and efficiently operated super-heterodyne receiver. But the fan may rest assured that he has a big job on his hands when he starts one. (THE END.)

Efficient Variocoupler

A good variocoupler should not have a big surplus of wire. It should be con-structed to efficiently receive a limited band of wave lengths, such as 200 to 600

It is not advisable to have one instrument cover a broad range such as from 200 to 3,000 meters, for in such a tuner losses occur, due to "dead" ends.

A variocoupler, in order to cover the broadcasting stations' wave lengths, should have about 80 turns of number 24 wire on a primary, or stator, 3½ inches in diameter. The rotor should have about 40 turns of number 26 wire.

Insulate Lead-In

It is always good practice in bringing a lead-in into the house not to let it touch anything. If the lead-in touches any metal, some of the signal strength will be absorbed. In some cases where the lead-in touches wood there is not much difference in the signals; however, when it rains the wood has the same effect as a metal object a metal object.

Modified Form of a Green Regenerative Circuit

Part II—Accessories, Assembly and Operation

By Myron P. Green

Dear Sirs:

I wish to thank you for publishing the two variometer hook-ups in the December 1st issue. I am using the hook-up as published with the addition of a 7-plate variable condenser in the aerial, and a 23-plate in the ground. In exactly two weeks I have heard 71 stations, and 2LO, London, on the morning of December 25th at 2:45 a.m., broadcasting from Westminister Abbey. I have written to them to verify this. Abbey. I verify this.

Verify this.

I get Los Angeles regularly and Ft. Worth, Tex., comes in as loud and clear as the local station on a crystal set. I can tune out powerful local station WTAM and tune in Ft. Worth, Tex., Chicago, Ill., Kansas City, Mo., etc. I can tune from 180 meters to 680 meters. Everyone who has heard this set in operation says it is the best he ever saw. I am using one WD-12 tube. This set acts like a super. I can use it without a ground or without an aerial, but am using ground.

What I want to know is how do you

What I want to know is how do you account for the unusual performance of this set and how could I add one stage of Radio frequency? Would it improve it much, or not?

I get a copy of your wonderful paper every week. Am enclosing a list of stations I heard in exactly two weeks' time. You may publish this if you wish and tell others of this good hook-

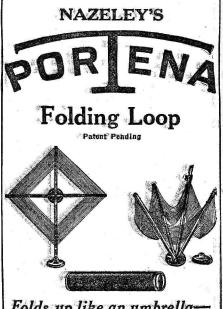

E. H. Richards, Cleveland, Ohio.

Editor's Note.—The Green circuit is ne one mentioned.

or any similar insulating material, as it possesses more tensile strength and is less likely to chip. Follow the old, and still best, plan of making a template before you ordinary paper slightly longer and wider than the panel. Paste it over the panel where it overlaps, center everything just as you wish the finished panel to appear and then drill all holes.

Mounting of Instruments

After removing the template, you are ready to mount your instruments. Care

THERE are a few ideas that will, perhaps, be worth while to you when constructing the Green circuit. While some of these instructions are old to many of you it is well to be sure before you go ahead.

Primarily, I suggest the use of bakelite

RECEIVED 2LO, LONDON

Dear Sirs:

I wish to thank you for publishing the two variometer hook-up as published with the addition of a 7-plate variable condenser in the acately two weeks I have head 71 stations, and 2LO, London, on the morning of December 28th at 2:45 a. m., broadcasting from Westiminister.

State of the contraction of the product of the propose of the states of the contraction of the propose of the propos

each lug, to remove any accumulation of dust or grease. Use very little flux and very little solder. Hold the iron on the terminal until the solder begins to flow and form in a little pool. If these direc-tions are followed you will have an absolutely perfect connection.

Accessories to Be Used

Accessories to Be Used

It is not necessary to use a grid leak
with this circuit if you use a UV-200
tube, but it is essential that the grid
condenser be of .0005-mfd. capacity. When
using the UV-199 tube I recommend a
variable grid leak, as very often each tube
even of the same make requires a different resistance.

An excellent socket for all standard

ent resistance.

An excellent socket for all standard bases is the one having a porcelain housing with metal top.

A good variocoupler is one that is made of fiberlike material with a wooden rotor. I have discarded all moulded tubes constructed of bakelite or rubber as I believe them responsible for a good deal of body capacity and possessing far too much rebound. rebound.

The same holds good of the variometers.

The same holds good of the variometers. They can be of the wooden variety as long as they are well made and wound to receive reception on high wave lengths.

As this circuit is very selective and critical it is a good idea to equip each variometer with a vernier type dial. It will be a 50 percent help in tuning.

It is not necessary to use a phone jack

For clearness of tone, amplification of voice and music from nearby and distant broadcasting stations, is unequaled by any Transformer on the market.

This set can be housed conveniently in a 7 by 18-inch cabinet, although I have used 7 by 24-inch largely when making these sets, as I believe plenty of space is far better than congestion of parts and

If a grain is desired on the panel, a fine grade of sandpaper or emery cloth number 00 may be used to rub down with. Rub only in one direction, preferably from left to right the long way. After the panel has been rubbed well and no bright spots show, dust with a soft cloth, wash off with a little 3-in-1 oil. This oil should be rubbed into the panel hard and consistently until you get that dull grained finish so much desired.

If you use a shelf attached to your panel, place it low enough down on the panel so If a grain is desired on the panel, a fine

If you use a shelf attached to your panel, place it low enough down on the panel so that when you slide the outfit into the cabinet, this shelf just engages the floor of the cabinet. Screw the shelf down to the floor of the cabinet using two long screws, one at each end. This eliminates the use of four or more screws on the face of your panel. of your panel.

Operation

However, there is really no limit to what may be achieved with a Radio set

properly made, dielectrically perfect, in conjunction with ideal Radio weather.

This circuit has proved itself under ideal and adverse conditions and I see no reason why you shouldn't be pleased with it.

(THE END.)

Range of Reception

The range of transmitting and receiving Radio messages depends upon the nature Radio messages depends upon the nature of the territory lying between the transmitting and the receiving stations, the greatest range for a given power being obtained over water. Any metal, particularly iron or steel, lying between the stations, will cause loss of signal strength. Such metal may either be in the form of artificial structures such as building frameworks or tin roofs, or may be in the form of ore deposits. Some regions of the country are noted for their poor location for Radio reception. In many places tion for Radio reception. In many places it is possible to receive effectively from all directions but one, and it is usually The important part in tuning this set is the manipulation of the two variometers. The adjustment should be by micrometer in its entirety. One calibration for the lack of receive electricity from all directions but one, and it is usually estimated to the structure or metal deposit is responsible micrometer in its entirety.

The Battery Charger Without a Weakness

Portable

Kerling

Rectifier

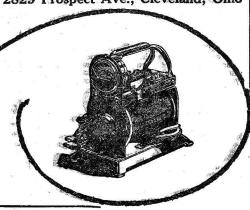

In line with recent developments in the radio battery field a number of improvements have been made in the design of this useful device. A five-ampere maximum charging rate has been adopted. The number of contacts has been reduced to one, affording greater simplicity and ease of adjustment without loss in efficiency. The quietness of operation, the almost total absence of sparking and the consequent free action and durability of the contact points mark a big advance in rectifier design.

Weagant Receiver Hook-Up or a 75-turn for the tickler. Experience has taught a great number of the franches ternity that Giblin-Remler coils are best larger and less troublesome. The tickler coil can be to the secondary and the secondary are secondary and the secondary and the secondary and the secondary are secondary as the secondary are secondary as the secondary are secondary as the secondary and the secondary are secondary as the secondary are seco Simple Regenerative Fool-Proof Set

THE FOLLOWING is neither an except from the Arabian Nights nor the brilliant discovery of a new-fangled receiver that will bring in signals when none exist. On the contrary it is the account of a simple regenerative set that is almost fool-proof, and which has given uniformly excellent results. Any Armstrong circuit, by the addition of a variable condenser, may be revamped into a Weagant without the slightest hesitation on the score of efficiency.

On account of the great variation in phone wave lengths, the desire of many

uniformly excellent results on arc, spark, phone and amateur sults on phone an phone and amateur waves since it was first published in 1918.

Five years ago, when Five years ago, when E. E. Bucher published his book on "Vacuum Tubes in Wireless Communication," he described a circuit devised by Roy A. Weagant, then chief engineer of the Marconi Wireless Telegraph company, which on account of its extreme simplicity was extreme simplicity was particularly recommended.

Rumor had it that Mr. We agant had evolved the circuit as a means of circumnavigating the famous Armstrong patent. But while he legally failed to do so, he nevertheless gave to the Radie world a substitute that for simplicity, universality and performance can hardly be "beat."

A stance of The Radie world a substitute that for simplicity and performance can hardly be "beat."

A glance at Figure 1 will acquaint the Radio enthusiast with the circuit. A little energy will suffice to provide the broadcast or amateur listener with a set of which he can justly be proud.

Parts of the Circuit

Getting down to a description of the parts of the circuit, the primary circuit, composed of L₁ and C₁, is the same as any standard regenerative set. It consists of a 50-turn coil in series with a .001-mfd. variable condenser. The secondary circuit is the typical inductance with capacity in parallel. The inductance value is a 50-turn coil and the condenser in shunt is a so-turn coll and the condenser in shunt is of the order of .0005 mfd. The tertiary, or tickler circuit as it is commonly known, consists of an inductance of 50 or 75 turns with a .0005 condenser in series, the whole placed in parallel with

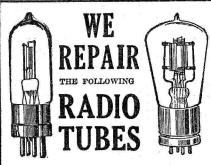

DESIGNED to permit infinite adjustment of currents used in vacuum tube. Gives absolute control of electronic flow and finest tuning possible. Fil-Ko-Stat will bring in DX you never heard before and shut out noise.

30 ohms full resistance. No adjustment to puzzle. discs to break. No Carbon Powder.

P. O. Box 22-A tation NEWARK, N. J. Clinton Hill Station

On account of the great variation in phone wave lengths, the desire of many fans for the arc and spark wave lengths, together with the experimenters who desire going down to 100 meters, a honeycomb coil mounting with three plugs is recommended to give the greatest versatility to this receiver.

Inductance Values

As a rule in the Weagant circuit the inductance value of L_3 is a trifle greater than that of L_2 . For example, if the secondary coil is of 50 turns, then best

results will probably be found with a tickler coil of about 75 turns, although many sets have given excellent results with a coil the same size as that of the secondary. The reason, apparently, is on account of the series capacity in the tickler circuit contrasted with the parallel capacity in the secondary.

For broadcast waves the reader should use a 50-turn coil for the primary, a 50-turn for the secondary and either a 50

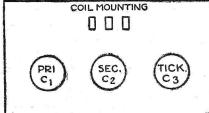

Figure 3.

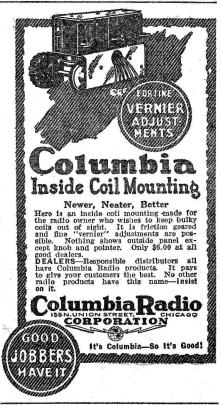

suited. For 100-meter work it is necessary to wind single layer coils of the dimensions given later in this article.

Hook-Up

After hooking up your apparatus, as shown in Figure 2, if the set fails to oscillate, reverse the two leads going to the back of the coil mounting on the tickler side so as to reverse the polarity of the winding. Sometimes, with a given value of tickler inductance a set will oscillate on high waves when the tickler is in one direction, and will oscillate on short waves when it is in the opposite direction. It will take only a moment to find the proper direction of winding. Also make sure that the series capacity C_s is not shorted. This will discharge your B batteries as this circuit is in parallel from the plate to the filament. filament.

Tuning

Tuning is accomplished by means of the secondary and tickler condensers, the primary, secondary and tickler inductances being set in one position. In the ordinary regenerative sets, regeneration is obtained by altering the inductive relationship of the coils, whereas in the Weagant circuit regeneration is brought about by chang-

THE chief radio engineer of Amrad says,
"The Bradleyleak is, without doubt, the
best grid leak and condenser now on the
market, and it is remarkably free from
noise." What better evidence is needed
that the Bradleyleak is different from other
grid leaks?

Remember, the Bradleyleak is not affected by atmospheric conditions. It is noiseless and has a smooth range of control from ¼ to 10 megohms. Try one, tonight.

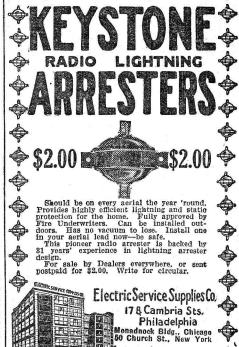

ALLEN-BRADLEY CO.

Single Circuit Tuner Changed to Reflex

Make Use of Old Set to Construct Reflex

In attempting to try the reflex circuits, the amateur hesitates about tearing down his present tuner. If he has a single circuit tuner, as shown in the diagram, he can convert it into a reflex circuit at very little

WORKSHOP KINKS? EARN A DOLLAR—

HERE are many little kinks worked out at home that would aid your fellow Radio worker if only he knew about them. There are new hook-ups, new ways of making parts and various unique ways of operating sets that are discovered every day. Radio Digest is very much interested in obtaining such material. Send day. Radio Digest is very much interested in obtaining such material. Send them in with full details, including stamped envelope, so rejected copy may be returned. The work must be entirely original, not copied.

RADIO KINKS DEPARTMENT,
Radio Digest,

123 W. Madison St., Chicago

expense and at the same time retain his set in its present form by simply throwing one switch and changing the grid leak.

The change from single circuit regenerative to reflex is made by throwing the D.P.D.T. switch to the right, as shown in the diagram, and by removing the grid leak cartridge and in its place inserting a cartridge which connects the secondary of the audio frequency transformer across the grid condenser. This special contrider was be condenser. This special cartridge may be made from a small fiber rod the same size as the variable grid leak with brass ends; the secondary wires being soldered to these ends. Do not use a D.P.D.T. switch in the grid circuit as the capacity and leak will be spoiled and will not be under good control.

The filament adjustment is very critical, The filament adjustment is very critical, hence a vernier rheostat should be used. The capacity of the fixed condensers is not critical with the exception of the grid condenser which should be .00025 mfd. Mica condensers should be used. The variometers have 38 and 36 turns each on their stators and rotors respectively. Twelve extra turns are on the stator of the second or plate variometer for inducthe second or plate variometer for inductive regeneration. The tube is a WD-11 with plate voltage of from 45 to 90. High voltage is required for loud signals. A galena detector gives loudest signals but is slightly unstable.

is slightly unstable.

The reflexed signals are much louder than is possible to obtain by inductive feedback, and the tone is purer. When the contact on the crystal detector is lifted from the crystal the set will either break into violent oscillations or the signal will become very faint. However, stations can be tuned in very sharply and the signal strength will be about as loud as when inductive feedback is used, by having the cat whisker raised from the crystal and tuning the plate circuit to bring it in resonance with the aerial or grid circuit, thus getting capacity feedback.

Regeneration with reflexing was tried

Regeneration with reflexing was tried but did not increase the signal strength and made the set much harder to tune, hence a double-throw switch was used as shown. With some tubes it will be found that the grid leak and the secondary of

CANADIAN NATIONAL CARBON Co., LIMITED Factory and Offices: Toronto, Ontario

Recharging, Testing and Care of Radio Batteries

A Radio battery is operated at ex-tremely low discharge rates, one, two or three amperes. It is not advisable to allow the battery to become more than three-quarters discharged, for this increases the formation of lead sulphate which is difficult to remove by recharging. which is difficult to remove by recharging. Testing with the hydrometer is very easy and probably the best method. The solution is drawn up in the hydrometer by means of a bulb and the specific gravity of the electrolyte may then be read by means of a graduated scale on the small float inside. The various stages of charge and discharge are seen at a glance.

Long distance stations ordinarily can not be heard with a crystal detector set.

The Stars Are Out Price \$1.25

THE STAR is a FIXT CRYSTAL DE-TECTOR for REFLEX OR CRYSTAL

It is a marvel of efficiency and its gold tipped filament is so secured that it may be thrown against a wall without danger of dislocation.

Try it with a horn on any good crystal set and you will have a crystal loud talker, if within five miles of any broadcasting station.

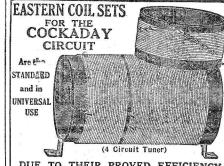

Sent on ten days' approval, postage paid, and you pay us when satisfied. All we ask that you send us the name of your dealer with your request.

WEAGANT RECEIVER

(Continued from page 28)

For long waves, take the coils you have been accustomed to using and you will find they work as well as on your old set.

For short waves, 100 to 250 meters, the author uses a 35-turn coil; a secondary of 17 turns of number 22 d.c.c., wound on a 17 turns of number 22 d.c.c., wound on a 2½-inch coil fitted with honeycomb plug, and a tickler of 25 turns wound on a 2½-inch tube (same size of wire). The tickler is placed inside the secondary, and its relationship fixed and forgotten. The same precaution of getting the proper polarity on the tickler coil should be observed. A honeycomb plug with about 6 inches of wire can connect from the tickler coil inside the secondary to the tickler receptacle on the coil mounting. The panel layout is shown in Figure 3.

In shifting from 100 meters to higher waves, simply pull out your two homemade coils and plug in the larger-sized coils.

As to the types of tubes, with the Navy As to the types of tubes, with the Navy VT-1 and 2, or almost any oxide coated filament tube, the grid leak will not be extraordinarily critical, and the set will oscillate with almost any B battery potential, giving good signals; with the gas content tube, such as the UV-200, the grid leak is a bit more critical and should be of a variable type. The UV-270, account of its great sensitivity, gives the most volume on phone wave lengths, while for continuous wave work the Navy tubes (L's) are time.

most volume on phone wave lengths, while for continuous wave work the Navy tubes (J's) are fine.

Unlike the Reinartz (a single circuit Weagant, after all) the Weagant is not an excessive radiator. The coupling between the primary and secondary prevents this to a marked degree. Selectivity gained with a Weagant receiver cannot be approached by any other receiver, even the three-circuit Armstrong, so far as the writer has been able to ascertain.

Another advantage of the Weagant over the Armstrong is the fact that the telephone cords (in the case of a single tube set) are not directly in the oscillating circuit and therefore will not be productive of body capacity.

It would be well for the Radio enthusiast, regardles of the type of circuit which he intends using to arrange all his variable connections on the condensers so there will be no potential in the circuit. This also obviates body capacity. In Figure 1 the condensers show a marking

there will be no potential in the circuit. This also obviates body capacity. In Figure 1 the condensers show a marking of M for movable plate which should go to low potential part, while the marking F should go to point of high potential. Summing up the Weagant, the outstanding advantages it possesses are: selec-

RETTER

BREMER-TULLY

B-T

Price 10c

tivity, universality, simplicity of control and lack of body capacity. Despite the abundance of trick circuits with which the Radio fraternity has been deluged in the past two years, it is refreshing to contemplate the Weagant as peer of them all, despite its five year age. Broadcast listeners and amateur operators, who have used the Weagant after trying all others are in accord with the opinion ventured

Review of Books

222 Radio Circuit Diagrams. A com plete and up-to-date collection of modern receiving and transmitting hook-ups. The book includes 284 diagrams and illustra-tions. Price, \$1.00. Within the Atom. By John Mills. May
